Current technological developments can be said to be quite high, where computers can recognize and know various objects, technology called artificial intelligence. Technological developments also increased in the ability to find locations and signify locations such as the Google Maps API. With the Google Maps API we only need to indicate the location and name the location as a location that is an important object in an area.

Information System Application for Tower Radio Mapping Using the Web-based Google Maps API is used to facilitate monitoring, maintenance, and responsiveness to overcome radio tower problems in several areas by marking the location of these points.

With the Information System Application for Mapping Tower Radio Using the Google Maps Web-Based API, the authors hope to help workers in the field to facilitate and accelerate the monitoring, maintenance and troubleshooting of the radio tower.

Key Word: Google Maps API, Java Script, MySql
