The use of internet networks is very useful for various types of activities to be easier to use and will be more efficient and faster in doing things. Usually in doing absences using paper, it is very wasteful for an agency's finances, so for that I made a web-based apprenticeship information system to be more efficient. To facilitate me in making this website aided by a framework called codeigniter. The advantages of this framework can be used for all laptops from low to high specifications because it can be operated by PHP version 5.1 and above, processing small file sizes is also faster. In the codeigniter there are MVC rules (model, view, controller) so that the code that we make is arranged properly
