Oemah Website, a Purwokerto website creation service and Purwokerto House Software, is present as a website development service company, website-based applications and information systems (PHP framework) as well as android applications in Banyumas, Cilacap, Yogyakarta, Solo, Semarang and other cities. In addition to the three main services. Oemah got a project to make a fetal prediction application. The author was given the task of making a simple interface for the application, where the application can help pregnant women who are far from the city center/away from the hospital to be able to control the state of their womb without having to come all the way to the hospital. The application can also view the history of previous examinations, view the results of the analysis of these examinations.
