

## ABSTRACT

*In Indonesia, the internet is something we often use in our daily activities. The internet helps humans to solve problems in almost all fields, both in the fields of education, work, and entertainment. But not all people can feel the positive impact of internet use, because the internet network has not yet entered the area. The Spread of Indonesian internet network is still not extensive, there are still many areas such as rural areas that have not been entered into the internet due to various factors. Therefore, PT Telkom Indonesia is trying to build internet network infrastructure in areas where there is no internet network. However, before the network is build, it also needs support from the community to be implemented properly. Therefore the development of network infrastructure in the regions aims to provide internet connection services that are good for the community. The results of this study are intended to introduce the internet network to the public by building a network around the area that does not yet have an internet network, by carrying out the stages in accordance with the procedure.*
