

ABSTRACT

Campus Teaching is one of the MBKM (Merdeka Learn Campus Merdeka) programs organized by the Ministry of Education and Culture. During the three-month deployment, many activities were carried out and had three main missions, namely teaching numeracy literacy to students, assisting school administration and most importantly adapting technology to school residents. The author raised the topic of technology adaptation because at SD No 030422 the role of technology is far from the word hope and has not touched what technology is starting from the principal, some teachers and all students have not been able to adapt to technology before the author came there even some students and teachers could not using technology media such as cellphones, laptops, etc. Even though in the current era it is mandatory to adapt to technology and technology has now reached Industry 4.0. In elementary school, the author still uses improvised media and there is no adaptation of technology, even teaching and learning activities are carried out manually and are far from the standardization of other schools. Here the author also makes a website to support technology adaptation in schools and introduces to a wider audience about the primary school where this writer is placed and makes a survey on technology adaptation for teachers and students in their level of satisfaction during the three-month deployment. Hopefully the website and the science of technology adaptation that the author provides can be a place for them to be creative and increase knowledge that will be applied to students so that they can adapt to technology.
