Website is one of the media to convey information consisting of a collection of pages on a domain on the Internet created with a specific purpose and interconnected and can be accessed widely through the front page or home page using a browser with the URL of the website. In the website there is a web page or web page that is a document written in HTML, which is usually accessed using HTTP or protocol to convey information from the website server to be displayed to the user through a web browser. Good website criteria namely, simple and easy to use design, loading the website not long, as well as interesting and relevant content. To find out if a website is good or not, it is necessary to do website testing.

Website Testing is a useful activity to evaluate the parameters or capabilities of the system and ensure that the website created has appropriate needs or expected results. The testing process consists of several steps, namely verification, validation, error detection. Testing activities carried out at Jenderal Corp are carried out on the website 'Sim-Bidan' where the website is one of the order projects that are being made by the company. After testing, the report of errors or errors found will be sent in the programmer section of the website. With the testing on the website is expected to reduce the risk of errors when the website works, know errors and prevent repeated errors, know the limitations of the system made, and become the basis to make the system better and in accordance with the wishes and needs.

Keywords : Website, Testing Website, Error.
