

ABSTRACT

Posyandu Purwokerto is a community service center in Purwokerto that serves babies and pregnant women who are engaged in health. Recording data with a book takes time 1. After the inspection, the community could not get the results and many people came again the next day to see the results of the examination at the posyandu. A lot of information is wrong and missing. The writing methods used include: interviews, namely discussions between the author and the team at cazh id in order to deepen the analysis of the problem and find solutions. Then there is a literature study, by studying the existing concepts and theoretical basis for retrieving data. Cazh id and researchers made a change to advance the posyandu by making a website. Website is built using wordpress CMS. The result of the research is a web system that can manage posyandu data and store data on examination results. The conclusion is that the posyandu website is a website to monitor the results of inspections at the posyandu quickly but at a relatively low cost. Routine guidance is needed to make it more efficient and effective. Adding an admin to access the website so that there are no data errors. Suggestions from researchers that the posyandu purwokerto be provided with internet so that many people can open the posyandu website. The existence of training on street vendors activities and for the admin is expected to back up figma and wordpress files.
