

ABSTRACT

The rapid development of technology has an impact that is very relevant to human daily life. The perceived ease of access in all fields is one of the positive impacts of technological developments, for example the use of mobile applications. The presence of mobile applications can be felt in all circles from young to old and has penetrated in all sectors such as tourism, education, health, and government. The Banyumas Regency Communication and Information Office has a project to make an application called Klinthung, this application is a mobile application that is used to provide access for the public to find and order services in the tourism sector in the Banyumas Regency area. The right user interface is needed in the development of an application so that later the user can achieve satisfaction with the use of the application. The method used to solve the problem in this report uses Waterfall. The waterfall method is a systematic and sequential information system development model.
