

ABSTRACT

In this era, the competition in the world of work is very tight due to globalization. Society is required to be able to accept new things and must be able to adapt to modernization. Street vendors are a solution to be able to overcome a problem in human resources at a time of globalization like this. The purpose of street vendors is as a medium for introducing the world of work, which of course is very much different from the application of concepts and theories that have been accepted by students while studying on campus. The benefit of making this PKL report is that it provides new knowledge to PKL participants to better understand how data input works using the SIM Asset application. In collecting data using 3 methods, namely Interview, Study, Library, and Practice. The Reconsolidation process has 5 stages, namely: Data Entry Stages for Receipt of the Warehouse Section, Data Entry Stages in the Calculation of Acquisition Prices for the Administration Section, Payment Data Entry Stages, Data Entry Stages for Administration Section Goods Release Orders, Data Entry Stages for Warehouse Releasing Orders. BOS Asset Reconsolidation is the process of matching data between institutions and the center using an application called SIM Aset. So for every incoming and outgoing item data, everything is required to be inputted and matched through the application. To support the process of inputting data on the Asset SIM application to be more efficient and effective, it is recommended that a PC or computer can be upgraded, because when charging data sometimes there is a lag/freeze considering that when doing these tasks multitasking is needed to speed up the execution of tasks and data entered from year by year more and more.
