The need for the internet for Indonesian people continues to grow as technology develops, entering the digital era of humans very closely with technology and the internet. The demand for internet network development is also increasing rapidly, Telkom Indonesia with its product IndiHome as a requirement for information communication technology networks and tecomunkasi seeks to help the community in building fiber optic networks for internet access. Planning for the construction of fiber optic networks needs to be done to facilitate the development process. Distance and availability factors are very influential on the development and comfort of users. Therefore, it is necessary to hold an analysis of the determination of the type of provisioning type (PT) to categorize the type of network development.

Keywords : Digital , Internet, Provisioning Type
