

ABSTRACT

DESIGN AND BUILD PROMOS AND ARTICLES INTERFACE IN CARDS APPLICATION USING REACTJS

Author :

Ade Prasetyo

The development of technology has an influence on the development of the transaction system in making business payments, especially in maintaining balance of various parties. The payment system, which is one of the pillars of the financial system, has been growing, which initially only applied cash payments, but has now become digital payments or electronic money (e-money) payments. PT. Cazzh Technology Innovation is currently working on an application called CARDS which provides online shopping and membership digital payment services. Currently, CARDS has collaborated with schools, Islamic boarding schools and SMEs. Currently, CARDS already has many active users, but does not yet have an interface to add articles and promos, this causes admins to have difficulties in providing information and promos to customers. Based on this problem, it is necessary to provide a feature to add information related to promos and articles. The result of implementing the ReactJS framework in this case is a promo and article management website interface. Using ReactJS can make it easier to manage articles and promos in real time which can add, modify and delete faster without reloading the page.

Keywords : ReactJS, CARDS, build interface
