

ABSTRACT

The flow of an inventory planning and payment activities at PT. Hudan Jaya Abadi is a suitable means for identification using the BPMN method. Because the company does not yet have a clear business process and inventory records and payment activities are still done manually, which has a high risk of data loss. In order for the planning and payment flow to be clear, BPMN is needed because this method will facilitate the distribution process to make it more transparent and make it easier for companies to collect detailed data on incoming and outgoing reports. This data collection method was carried out by conducting questions and answers to the field supervisor and the main director of PT. Hudan Jaya Abdi during the Field Work Practice and also by reading and observing various sources that have similarities with the author's report. The author is given the task and performs an analysis of the flow of the inventory planning process and the flow of payment activities. After the analysis was carried out, the authors found the advantages and disadvantages. Companies need to innovate online data entry and minimize the number of sheets that must be filled out when submitting a logbook, and also in conducting financial data collection, companies need to implement financial calculation applications to be more effective and efficient.
