Tourism is one of the important sectors in the Indonesian economy and is the number 3 contributor after exports of coconut oil and coal. In last year of 2019, the world was rocked by the COVID-19 outbreak in several, including Indonesia, especially in the sector. One alternative way that can be applied during the current pandemic is to use technology, namely virtual tours. The use of technology and the internet is put to good use by PT. Tourezia, where in order to keep the tourism industry running, PT. Tourezia designed a virtual tour website information system. The website is made with full features such as home page, preview, find a destination, explore, and about us. Making a virtual tour website about us uses the Laravel framework, text editor software using Visual Studio Code, XAMPP and code management using Bicbucket. The method used in making the website is the scrum method. The display on the about us page is in the form of a website profile and a form that aims to evaluate the website in the future.

Keywords: Tourist, Website, Virtual Tour, Scrum, About Us.
