Website is an internet media that is often visited by everyone and has basic components in the form of HTML, CSS, and JavaScript which are rendered into a user interface using web technology. User interface affects user experience and has a design that plays a role. UI design is converted into a website as a tangible form that the design created plays a role or not. In creating a website, there are five stages, namely creating code, reviewing with various perspectives, integrating with WordPress, creating theme options, and presenting results. Difficult stage in creating a website is development stage, where the developer not only adjusts the existing design but adapts to the user's device in terms of screen size, operating system, etc. Self-development, code development can be done quickly and precisely.
