Information and communication technology (ICT) has an important role in all sectors. One of them is in the business sector. PT Indonesia Comnets Plus (ICON+) focuses on providing telecommunications networks, services, and content, specifically to support system information and technology of PT PLN (Persero) and public. This company has warehouse/inventory division. The inventory at Icon+ Medan provides customers with materials that will be used for the installation of Iconnet. At the Icon+ Medan warehouse, the process of ordering equipment out or picking up materials is still not optimal. The recording of taking the materials is using google form. Therefore, the author makes a web-based information system that is used for retrieval of materials at the Icon+ Medan warehouse with the AdminLTE template and CodeIgniter framework and hope that the website can make it easier for engineers to take materials and make Icon+ warehouse inventory work faster and more efficient.

Keywords: Website, Warehouse, AdminLTE, CodeIgniter
