**Abstract**—This research aims to compare two Web Servers on Single board computer (SBC). Sbc is usually used for IoT applications because only needs a small amount of power and is compact in size. Raspberry Pi 4 Model B with 8GB of RAM and 128GB SD Card is used in this research. We compare Apache Web Server and Nginx as web servers. WordPress and Apache Benchmark are used to evaluate the performance of web servers. The servers were tested with 10, 25, 50, and 100 concurrency levels with 1000 requests every test.

**Index Terms**—single board computer, apache, nginx, web server

## I. INTRODUCTION

Single board computer are becoming more affordable with the development of ARM Processor. Their productivity is increasing steadily. Most of them do not required forced cooling, which makes them quieter, more realible and energy-saving. Such a device consume about 5W on the average [1]. Raspberry Pi is small single board computer series. The Raspberry Pi 4 Model B is the first of a new generation of Raspberry Pi computers supporting more RAM and with significantly enhanced CPU, GPU and I/O performance. RPi4B is available with many size of RAM [2]. Raspberry pi is the low power consumption, cheap price and it has been widely implemented in the development of IoT technology [3]. Raspberry Pi can run with many Linux OS, Raspberry Pi OS is one of them, that supported by Raspberry Pi.

Web servers development is always challenging. Servers need to perform efficiently for attending request from thousand of clients simultaneously. The performance of web servers plays a key role in a large and growing community of web users. Apache is open source web server that widely-used. Apache uses multi-proces architecture and multi-thread architecture. Nginx is second widely-used open source web server, uses asynchronous multi-process event driven architecture [4].

Thanks to Institut Teknologi Telkom Purwokerto for funding this research.

A content management system (CMS) is any system used to create and publicize digital content, including a platform for creating static sites, blogs, online stores, forums, and others in between. WordPress is one of the well-known CMSs including Joomla, Drupal, and all the others [5]. WordPress had 68.7% of the CMS technologies based on market share in 2022 [6]. WordPress recommends host supports PHP version 7.4 or greater, with Mysql 5.7 or greater or MariaDB version 10.3 or greater and HTTPS Support [7].

## II. EXPERIMENT

This research used two Raspberry Pi 4 B with 8GB of RAM and 128GB of storage. Raspberry Pi OS is used for the operating system, one RPi4B using Apache and the other using Nginx. The server deploys a WordPress with PHP-FPM and MariaDB for the databases. The WordPress uses default theme and default test post without any changes. Apache benchmark used for generating the traffic and performing the test. Apache benchmark is a tool for benchmarking HTTP Server, this will show how many requests per second the server is capable to serve [8].

A raspberry pi OS was installed, new user account was added to the OS. The user is added to the sudoers list, so the user is capable to execute command that requires administrative privileges. Before starting the software installation, the first step was to update the software package. After the update is complete, on the first RPi4B install an apache HTTP server, and on the second RPi4B install the Nginx server. After installation is complete, test the web server by accessing the IP address of each server using a web browser. All web server comes with default configuration, no tweak was performed on this research.

The next step was to install the PHP and PHP-FPM to support the PHP programming language and related extensions. MariaDB was installed as a database service for the server. Specific user created for accessing the

database from WordPress. Create a database WordPress, and install WordPress on the server.

All WordPress file placed on /home/konten/web/wordpress directory. Every server has one VirtualHost with a custom domain, each wp1.nginx.ittp for the Nginx server and wp1.apache.ittp for the apache server.

Every server was tested with apache Benchmark. Test conducted with 10, 25, 50, and 100 concurrency levels with 1000 total complete requests. Each test scenario was repeated 10 times.

### III. RESULT

#### A. 10 Concurrency Levels

The first test was conducted with 10 concurrency levels and repeated 10 times on each web server. Apache web server gets 14.23 requests per second for the lowest, 14.53 requests per second for the highest, and 14.45 requests on average requests per second. On the Time per request concurrent, apache gets 702.852ms for the highest result, 688.257ms for the lowest, and 692.189ms on average time per request concurrent. The mean time per request across all concurrent requests results in 70.285ms for the highest result, 68.826ms for the lowest, and 69.219ms for the average time per request. Table I shows the details result of the Apache web server with 10 concurrency levels.

TABLE I  
APACHE WITH 10 CONCURRENCY LEVELS

Test Number	Request per second	Time per request (Concurrent) (ms)	Time per request (ms)

The Nginx server gets a better value for each parameter. On the requests per second parameter, the Nginx server gets 14.56 requests per second for the lowest, 14.74 requests per second for the highest, and 14.62 requests on average requests per second. On the Time per request concurrent, Nginx gets 686.586ms for the highest result, 678.345ms for the lowest, and 683.845ms on average time per request concurrent. Time per request concurrent, Nginx gets 6868.050ms for the highest result, 6789.573ms for the lowest, and 6845.501ms on average time per request concurrent. The mean time per request across all concurrent requests results in 68.681ms for the highest result, 67.896ms for the lowest, and 68.455ms for the average time per request. Table VIII shows the details result of the Nginx server with 100 concurrency levels.

#### IV. CONCLUSION

The result shows the performance of Nginx is better than Apache web server. Figure 1 shows the average requests per second on each concurrency level, the result gives less than 0.1 difference on each level. The highest average requests per second were achieved by the Nginx server with 14.62, and the lowest average requests per second come from Apache with 14.45. Figure 2 shows the average time per request on every concurrency level, Nginx gives better performance with 68.38 ms average time per request than Apache with 69.22 ms average

time per request. Figure 3 shows the average time per request (Concurrent), Nginx still overcomes apache on these parameters.

Fig. 1. Average Requests per Second.

Fig. 2. Average Time per Request.

Fig. 3. Average Time per Request (Concurrent).

The results show the overall performance of Nginx comes better than Apache web server on RPi4B with 8GB of RAM.
