In the world of education, of course there are many problems that often occur and become one of the difficulties for teachers in carrying out their duties. Indeed, one of the tasks of educators is to provide solutions to problems faced by students in the learning environment. However, this is not an easy thing because as educators, we must maximize our role in schools and provide support to provide solutions to problems faced by students. Students often experience many varied and quite complicated problems, so that sometimes they feel confused about finding solutions to existing problems. Students really need support from guidance and counseling, but in reality, these services are often unable to fulfill their role in dealing with the problems they face. Some students will only convey their problems if demanded by the guidance and counseling teacher, even though the service does not only see problems from the student's point of view, this causes a wrong view of guidance and counseling services. Therefore, guidance and counseling in schools is not only the responsibility of the school. The family must also play a role as a companion in the formation of the child's character and family development, as well as the social environment in which the child lives. Currently, there are still many teenagers who experience confusion, unpreparedness, and stress in making career decisions. They don't care about their career choice and only follow their friends, who, if ignored, will have a negative impact. In this research using the thinking design method which consists of 5 processes, namely Empathize, Define, Ideate, Prototype and testing. The purpose of this study is to make it easier for teachers and students when conducting counseling. The results in this study are designing a website using the thinkking design method and testing using the blackbox testing method and getting the appropriate results in testing.
