The development of information technology has become an important thing because many organizations have implemented it. The application of information technology is also used by government organizations with the aim of supporting the interests of these organizations. The Government of Purbalingga Regency through the Office of Communication and Information (Dinkominfo) of Purbalingga Regency has implemented website-based information technology to report complaints of alleged criminal acts of corruption involving employees or other parties in the organization where the complainant works. However, the system is still in the form of a WordPress template and there are still some features that the website does not yet have. Thus, it is necessary to redesign the website in order to improve the website by completing various features that do not yet exist. This website redesign was built using the Laravel and Tailwind CSS frameworks using Visual Studio Code, and using a MySQL database. So that with the latest features on the Purbalingga Regency whistle blowing system website, it can provide convenience for the public in reporting complaints related to corruption cases that occur in the surrounding environment. Then, it is still necessary to develop a website on a regular basis so that the website can run optimally.

Keywords: *Website, whistle blowing system, Laravel, Tailwind CSS, MySQL, Visual Studio Code, PHP, HTML, JavaScript, CSS*
