

ABSTRACT

The development of telecommunications technology is in fact very important in human life. However, accompanied by this very fast development, in fact there are still many areas that have not been reached by telecommunication signals, in Rejang Lebong district there are at least 17 villages that have not been reached by telecommunication signals. Therefore, the relevant agency proposed the construction of a telecommunications tower (BTS) in the area. First, the relevant agency conducts a drive test to obtain data in the form of the presence or absence of telecommunication signals from several providers at that location. After getting the location data of the relevant offices, you can apply for the construction of BTS for that location through the PASTI BAKTI application in the order of filling according to the instructions in the application. After following all the steps in the PASTI BAKTI application, the location data entered in the PASTI BAKTI application will automatically be sent to email. DEVOTION. Then BAKTI will answer the e-mail with a statement whether or not the BTS construction is approved at that location. BAKTI chose the location with several considerations, including the location must be included in the development priority or the 3T area (Front, Outermost, Disadvantaged). Unfortunately, the area proposed by DISKOMINFO Rejang Lebong was not approved because BAKTI assessed that the area was not included in the category 3T (Front, Outermost, Disadvantaged) area which was not a priority area
