Information technology (IT) is a technology that can be used to manage data, including processing, aggregating, storing, and processing data in various ways to produce high-quality data. PT Asia Pro Berjangka has a business system involving IT, but in its business system there are still conventional features which can disrupt the ongoing business system. The conventional system that will be developed is the online registration menu feature using the waterfall method with three stages, namely the needs analysis phase, the design phase, and the coding phase. The coding process is assisted by the boostrap feature to enhance the appearance of the online registration feature. The results of the development of the online registration feature can make it easier for customers to create a trading account at the Asia Pro Futures Forex Broker.
