As the development of information technology has affected various aspects of the world of work, in the office sector, almost all work uses computers. The Pekalongan Regency Education Office is an education service office in Pekalongan Regency, the information provided by the Pekalongan district education office has used the internet, of course this has been very effective, but the making of the website for the Pekalongan district education office has not used a framework which later when the programmer from the district education office Pekalongan is replaced with a new programmer which will cause a problem where the location of the website file for the Pekalongan district education office is only the developer who makes it known and the new developer will have difficulty maintaining the Pekalongan district education office website, so it is necessary to build an information service website for the Pekalongan district education office using the codeigniter framework so that the website is easy to maintain by new developers because if you use a structural framework from the website there is already a standardization of the framework but developers have to learn Regarding the framework used, of course it will be more efficient if you have to study the website structure made by old developers because the structure is made based on the wishes and understanding of old developers.
