ABSTRACT

Today's telecommunications technology is growing rapidly, including telecommunications service providers. The field of telecommunications can be said to have a very important role in people's lives, this is because in the field of telecommunications it can meet the needs of the community in the form of sending and receiving information quickly and efficiently. Even today, telecommunications technology is increasingly evolving. With the evolution of this telecommunications technology, one of the things that needs to be done is maintenance, which requires data validation between in the field and the system in the office by the Data Management division, namely by using the Valins website. However, in conducting instant data validation (valins) of course there can still be problems where service data on the system is not detected, so it is necessary to update the valins service on the Valins website where the results of the update will bring back service data on the system.

Keywords: telecommunications, data validation, maintenance, valins id.
