

ABSTRACT

The Central Bureau of Statistics is an institution that plays a role in providing data needs for the government and the public. The Central Bureau of Statistics for Purbalingga Regency conducts regular data collection activities through censuses, surveys or observations assisted by partners. The division of labor for each partner is not evenly distributed and there are problems in the honor payment process. This obstacle is due to the recording and division of work which is still done manually by one of the routine partner representatives. The purpose of this writing is to apply web programming courses to design and create website-based partner management applications.

The method used in this writing is observation by the author with direct practice at the Purbalingga Central Bureau of Statistics, discussions to obtain explanations regarding existing problems, and literature studies by seeking information from several related sources.
