Dinas Komunikasi and Informatika of the Cilacap Regency is currently developing electronic-based government system innovations. The problem of waste in Cilacap has not been resolved properly, especially public awareness in managing the waste itself, the lack of waste disposal facilities in several areas in Cilacap is one of the factors in this problem. From the existing problems, a website-based garbage donation application was created.

The process of making this website uses the role of the Laravel Framework and SB Admin 2. Later, the community can distribute their household waste to collectors, if any. If the community wants to register as collectors in certain areas, they can register with the environmental service of the Cilacap Regency.

The results of this Field Work Practice are expected to make it easier for the community to distribute waste to collectors so that it can be managed properly and support the achievement of the Electronic-Based Government program in Cilacap Regency.
