

FAKULTAS ILMU KOMPUTER
UPN VETERAN JAKARTA

PROCEEDINGS

4th INTERNATIONAL CONFERENCE

ICIMCIS

INFORMATICS, MULTIMEDIA, CYBER, AND INFORMATION SYSTEM

ICIMCIS PROCEEDINGS 2022

2022

2022 International Conference on Informatics, Multimedia, Cyber and Information System (ICIMCIS) | 978-1-6654-7327-9/22/\$31.00 ©2022 IEEE | DOI: 10.1109/ICIMCIS56303.2022.10017840

2022 International Conference on Informatics, Multimedia, Cyber and Information System (ICIMCIS)

Organizing Committee International Advisory Committee

- Dr. Ing Wahyudi Hasbi, S.Si, M.Kom. - IEEE IS Chair
Prof. Dr. Ir. Gamantyo Hendrantoro, Ph.D. - IEEE IS Vice-Chair
Ir. Linawati, M.Eng.Sc., Ph.D. - IEEE IS Secretary
Dr. Karlisa Priandana, M.Eng - IEEE IS Vice Secretary
Dr. Kemas Muslim Lhaksmana - IEEE IS Treasurer
Dr. Prima Dewi Purnamasari, S.T., M.Sc - IEEE IS Vice Treasurer
Dr. Anter Venus, MA, Comm – Rector Universitas Pembangunan Nasional Veteran Jakarta, Indonesia
Dr. R. Dudy Heryadi, M.Si – Vice Rector for Academic Affairs Universitas Pembangunan Nasional Veteran Jakarta, Indonesia
Dr. Ec. Prasetyo Hadi, SE., MM., CFMP – Vice Rector for General and Financial Affairs Universitas Pembangunan Nasional Veteran Jakarta, Indonesia
Dr. dr. Ria Maria Theresa, Sp.KJ., MH. – Vice Rector for Student Affairs and Cooperation Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Steering Committee

- Prof. Teddy Mantoro – Universitas Sampoerna, Indonesia
Prof. Achmad Nizar Hidayanto - Universitas Indonesia, Indonesia
Prof. Dr. Achmad Benny Mutiara Q.N. – Universitas Gunadarma, Indonesia
Prof. Dra. Sri Hartati, M.Sc., Ph.D – Universitas Gajah Mada, Indonesia
Prof. Dr.Ir. Agus Buono, M.Si, M.Kom – IPB University, Indonesia
Prof. Dr. Ir. Siti Nurmaini, MT – Universitas Sriwijaya, Indonesia
Dr. Djuniadi, MT – Universitas Negeri Semarang, Indonesia
Dr. Ermatita, M.Kom – Universitas Sriwijaya, Indonesia
Dr. Didit Widiyanto – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia
Dr. Tjahjanto – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia
Dr. Widya Cholil, S.Kom., M.IT – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia
Dr. Bambang Saras – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia
Dr. Deris Setiawan - Universitas Sriwijaya, Indonesia

General Chair

- Dr. Widya Cholil, S.Kom., M.IT – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

General Co-Chairs

- M. Octaviano Pratama, S.Kom, M.Kom. – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Secretarial

Kraugusteeliana, M.Kom., MM – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Diyah Retnowati, S.Kom – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Saimin, S.Kom – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Event, Publicity, Website & Documentation Division

Ati Zaidiah, S.Kom., MTI – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Andhika Octa Indarso, MMSI – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Astrianto Afandi, Amd.Kom – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Didit Suryahartono, S.Kom – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Mochammad Fariz Setyawan, S.Kom – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Proceeding Division

Erly Krisnanik, S.Kom, MM – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Artika Arista, S.Kom., MMSI – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Ika Nurlaili Isnainiyah, S.Kom, M.Sc – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Helena Nurramdhani Irmada, S.Pd., M.Kom. – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Muhammad Adrezo, S.Kom, M.Sc – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Ria Astriratma, S.Kom, M.Cs - Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Neny Rosmawarni, M.Kom - Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Muhammad Panji Muslim, S.Pd., M.Kom. - Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Mustofa Galih Pradana, M.Kom - Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Triando Damiri Burlian, S.Kom, M.S.Eng, M.Sc. – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Novi Trisman Hadi, S.Pd., M.Kom. - Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Financial

Rudhy Ho Purabaya, SE., MMSI – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Yami - Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Suryadi, Amd.Kom - Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Administration & Logistic

Musenah, S.Pd, M.Kes – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Zaenudin – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Abdul Rahman – Universitas Pembangunan Nasional Veteran Jakarta, Indonesia

Table of Content

IT Capabilities Analysis Towards the Organization Performance in the Virtual Organization: A Case Study of ABC Multifinance Company in Indonesia..... 1

Dewi Rokhmah Pyriana (University of Indonesia, Indonesia); Hidayat Akbar (Universitas Indonesia, Indonesia); Muhammad Muslim Rifa'i (University of Indonesia, Indonesia); Sandriyana Kusuma Wardani and Suci Inayah (Universitas Indonesia, Indonesia); Muhammad Rifki Shihab (Faculty of Computer Science, Universitas Indonesia, Indonesia) 1

E-Warung Systems Development 7

Cornelia Tri Wahyuni (Universitas Bina Darma, Indonesia); Darius Antoni (Universitas Indo Global Mandiri, Indonesia); Widya WH Cholil, MIT (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia) 7

Diagnosing the Impact of Digital Resources and Remote Leadership on Telework Productivity 12

Nopriadi Saputra (Bina Nusantara University, Indonesia); Kiki Suidiana (Telkom University, Indonesia) 12

Public Government Web Based Services Quality Assesment Using Webqual and Govqual in Palembang City Government..... 19

Widya WH Cholil, MIT (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia); Lalilatur Rahmi (Politeknik Negeri Sriwijaya, Indonesia); Anita Muliawati, Jayanta Jayanta, Rio Wirawan and Helena Nurramdhani Irmanda (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia) 19

Empirical Review of M-Banking User Satisfaction Using End User Computing Satisfaction (EUCS) 25

Dedy Syamsuar (Bina Nusantara University, Indonesia); Widya WH Cholil, MIT (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia); Rio Ramadhan (Universitas Bina Darma, Indonesia); Ruth Mariana Bunga Wadu (Jalan RS. Fatmawati Raya, Pd. Labu, Kec. Cilandak, Indonesia); Ati Zaidiah (UPN Veteran Jakarta, Indonesia); Nia Oktaviani (Universitas Bina Darma, Indonesia)..... 25

Small Medium Enterprise Social Media Ranking Using Analytic Network Process ..30

Khairun Nisa Meiah Ngafidin, Citra Wiguna and Rona Nisa Sofia Amriza (Institut Teknologi Telkom Purwokerto, Indonesia) 30

Identifying Shill Bidder Presence in Online Auction Using Dynamic Detection Strategy 36

Felesia Felesia, Ivanco Gratio Hartono, Monica Ruth Fabiola Winata, Henry Lucky and Andry Chowanda (Bina Nusantara University, Indonesia)..... 36

Development of Mobile-Based Information Letter of Rukun Tetangga and Rukun Warga With Mern Stack Method..... 43

Gregorius Wisnu Wijanarko Tiba and Haris Rangkuti, Mr (Bina Nusantara University, Indonesia)..... 43

Development of E-Learning Applications to Support Student Learning..... 49

Arvin Rizki Andriaputra, Dicky Bima Pradana Resmana, Nico Marzuki and Haris Rangkuti, Mr (Bina Nusantara University, Indonesia) 49

Use of Blockchain for Designing Digital Documents in Public Services..... 55

Darius Antoni (Universitas Indo Global Mandiri, Indonesia); Muhammad Izman Herdiansyah (Universitas Bina Darma, Indonesia); Muhamad Akbar (Universitas Sriwijaya, Indonesia & Universitas Bina Insan, Indonesia); Widya WH Cholil, MIT (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia); Hadi Syaputra (Universitas Sriwijaya & Universitas Bina Darma, Indonesia) 55

The Role of Vlog Content and Vlog Enjoyment on Developing Marketable Travel E-Commerce to Millennial Audiences 61

Martinus Fieser Sitinjak (Bina Nusantara University, Indonesia); Azizah Omar (USM, Malaysia); Yopy Maulana (Bina Nusantara University, Indonesia) 61

A Systematic Review of Business Process Management in E-Commerce 66

Thalea Christy Nathaniela, Agung Purnomo and Satria Fadil Persada (Bina Nusantara University, Indonesia); Elsa Rosyidah (Universitas Nahdlatul Ulama Sidoarjo, Indonesia)..... 66

Effectiveness Analysis of Using the Vehicle Tools Feature on ERP Systems With Delone & McLean Approach at PT. Putra Mulia Telecommunication..... 71

Azizah Tsana Putri, Haffiz Galuh Pratama Pratama, Orchidea Safira and Sucianna Ghadati Rabiha (Bina Nusantara University, Indonesia) 71

Applying for E-Signature Approval With TOGAF Framework to Improve Productivity: Case Study SAP Document Management System..... 77

Cynthia Dewi Tanuraharja, Kania Alma Tiara, Gunawan Wang and Hendra Alianto (Bina Nusantara University, Indonesia) 77

Analysis of Stakeholder Satisfaction Using ITILv4 for Data Management in Telkomsat ERP..... 82

Nugroho Wibisono (Swiss German University & PT Telkom Satelit Indonesia (Telkomsat), Indonesia); Heru Ipung, Amin Soetomo and Eka Budiarto (Swiss German

University, Indonesia); Ayu Putri Sakinah (IPB University, Indonesia & PT Telkom Satelit Indonesia, Indonesia); Rian Fitriana (PT Telkom Satelit Indonesia, Indonesia)82

A Literature Review Knowledge Management for Traditional Retail Business Strategies..... 88

Dien Novita (Universitas Sriwijaya & Universitas MDP, Indonesia); Ermatita Ermatita (Sriwijaya University & Computer Science Faculty, Indonesia); Samsuryadi Samsuryadi and Dian Palupi Rini (Universitas Sriwijaya, Indonesia)..... 88

Financial Auditor Efficiency and Effectiveness in Remote Audit Transition Due to Pandemic of Covid-19..... 94

Bambang Leo Handoko and Ang Swat Lin Lindawati (Bina Nusantara University, Indonesia); Hery Harjono Muljo (School of Information Systems, Bina Nusantara University, Indonesia) 94

Functional Requirements and Traceability System Information Modeling on Java Preanger Coffee Supply Chain 99

Bonang W Ligar (Gunadarma University, Indonesia); Sarifuddin Madenda (Gundarma University, Indonesia); Sutrisno S Mardjan (IPB University, Indonesia); Tubagus Maulana Kusuma (Gunadarma University, Indonesia)..... 99

Analysis and Design of Supply Chain Management System at CV Putra Nusantara Mandiri 105

Nomane Danke Zaidane, Sheline Rizkyka Giovani, Rizki Putra Bahari and Sucianna Ghadati Rabiha (Bina Nusantara University, Indonesia) 105

Identifying Value at Risk in the Real Estate Sector Through the Application of Monte Carlo Simulation 111

Dicky Hida Syahchari and Anggraeni Woro Hapsari (BINUS University, Indonesia)111

Model for Detect Hand Sign Language Using Deep Convolutional Neural Network for the Speech/Hearing Impaired 118

Alfredo Lorentiar Santonanda, Fransisca Cicilia Margono, Rachmat Kurniawan, Henry Lucky and Andry Chowanda (Bina Nusantara University, Indonesia)..... 118

A Preliminary Study of Decision Support Model of Photovoltaic for Village Area in South of Sumatera..... 124

Feby Ardianto (Universitas Muhammadiyah Palembang, Indonesia); Ermatita Ermatita (Sriwijaya University & Computer Science Faculty, Indonesia); Armin Sofijan, AS (Sriwijaya University & Faculty of Engineering, Indonesia); Vina Ayumi (Universitas Mercu Buana Jakarta, Indonesia); Handrie Noprisson (Universitas Mercu Buana, Indonesia); Mariana Purba (Universitas Sjakhyakirti, Indonesia) 124

Identification of Meteorological Parameters Affecting Dengue Hemorrhagic Fever Incidences..... 130

Faisal Asadi, Joko Pebrianto Trinugroho, Alam Ahmad Hidayat, Reza Rahutomo and Bens Pardamean (Bina Nusantara University, Indonesia) 130

Scientometric Analysis of Artificial Intelligence Research in Agriculture..... 136

Fairuz Iqbal Maulana and Andi Pramono (Bina Nusantara University, Indonesia); Miftahul Hamim (Language Center, Bina Nusantara University, Indonesia); Sukeipah Yuli Prihatin (Politeknik Kota Malang, Indonesia); Rahman Arifuddin (University of Merdeka Malang, Indonesia)..... 136

Indonesian Traditional Food Image Recognition Using Convolutional Neural Network 142

Gredion Prajena, Jeklin Harefa, Alexander Alexander, Bernhard Owen Josephus and Ardianto Hermawan Nawir (Bina Nusantara University, Indonesia) 142

Calculating the Similarity of Indonesian Sentences Using Latent Semantic Indexing Based on KBBI 148

Muhammad Panji Muslim (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia); Arief Fatchul Huda (Universitas Islam Negeri Bandung & Telkom University, Indonesia) 148

Evaluation of Software Quality Assurance Silampari Smart City of Lubuklinggau Based on ISO/IEC 25010:2011 Analysis Model 154

Yayan Indra Irawan (Bina Darma University, Indonesia); Edi Surya Negara (Universitas Bina Darma, Indonesia)..... 154

Time-Series Analysis of Correlation Between Climatic Parameters and Dengue Fever in Indonesia..... 161

Rudi Nirwantono (Binus University, Indonesia); Joko Pebrianto Trinugroho, Digdo Sudigyo, Alam Ahmad Hidayat and Bens Pardamean (Bina Nusantara University, Indonesia) 161

A Fatigue Detection Model Based on Convolutional Neural Network 166

Daniel Wijaya, Michael Stanley, Pascal Wilman, Henry Lucky and Andry Chowanda (Bina Nusantara University, Indonesia) 166

A Literature Review on the Impact of Effective Management in Cyber Security System Performance 172

Luis F Salim, Stephanus Harjono, Ferdinand Gunawan, Jurike Moniaga and Indra D Rianto (Bina Nusantara University, Indonesia) 172

Comparative Analysis of Usability, Performance, and Security of Open-Source, Windows-Based Password Manager Applications Based on ISO/IEC 25010..... 178

Lettisia Nurdayenti (Badan Siber dan Sandi Negara, Indonesia); Amiruddin Amiruddin (Politeknik Siber dan Sandi Negara & Badan Siber Dan Sandi Negara, Indonesia) .. 178

A Case Study of Digital Forensic Readiness Level Measurement Using DiFRI Model 184

Ilham Zulfahmi Baiquni (Badan Siber dan Sandi Negara, Indonesia); Amiruddin Amiruddin (Politeknik Siber dan Sandi Negara & Badan Siber Dan Sandi Negara, Indonesia) 184

Cyber Threats and Scams in FinTech Organizations: A Brief Overview of Financial Fraud Cases, Future Challenges, and Recommended Solutions in Bangladesh 190

Md. Jafrin Hossain, Rejuan Haque Rifat and Mahadi H Mugdho (BRAC University, Bangladesh); Mohona Jahan (Mohakhali, Dhaka, Bangladesh); Annajiat Alim Rasel (Brac University, Bangladesh); Muhammad Abdur Rahman (BRAC University, Bangladesh)..... 190

Impact Analysis of Crypto Miner Malware Attacks Using Android Debug Bridge (ADB) Vulnerabilities via TCP/IP on Android-Based Raspberry Pi 4 IoT Device ... 196

Aidil Yusuf Priadi (National Cyber and Crypto Polytechnic, Indonesia); Arizal Arizal (Politeknik Siber dan Sandi Negara, Indonesia) 196

Flubot Malware Hybrid Analysis on Android Operating System..... 202

Hanifah Salsabila (Poltek Siber dan Sandi Negara, Indonesia); Syafira Mardhiyah (Politeknik Siber Dan Sandi Negara, Indonesia); Raden Budiarto Hadiprakoso (Poltek Siber dan Sandi Negara, Indonesia) 202

Implementation of Rail Fence Cipher and Myszkowski Algorithms and Secure Hash Algorithm (SHA-256) for Security and Detecting Digital Image Originality 207

Rojali Rojali, Zulfany Rasjid and Justin Cliff Matthew (Bina Nusantara University, Indonesia)..... 207

Implementation of PRESENT Algorithm on Contactless Access Control Using Raspberry Pi..... 213

Nazela Khairani Putri and Dion Ogi (Politeknik Siber dan Sandi Negara, Indonesia)213

Comparison of IPv6 Dynamic Routing Protocols on Routing Hole Handling 219

Novi Trisman Hadi (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia)219

Comparison of Machine Learning Techniques on Snort for Predicting Realtime DoS and Probe Attack 224

Achmad Husein Noor Faizi, Dimas Febriyan Priambodo and Fika Dwi Rahmawati (Politeknik Siber dan Sandi Negara, Indonesia) 224

Waterfall Model for Design and Development Coffee Shop Website at Malang..... 230

Andreas Yan Ardhiansyah, Dion Lamilga Sudiono Putra, Jsven Septian K, Nadya Budhianto and Fairuz Iqbal Maulana (Bina Nusantara University, Indonesia) 230

Low Fidelity Prototype Design to Facilitate BEELIC Website Navigation Process for Information Center 235

Hervina Aprilia (Universitas Bina Nusantara, Indonesia); Arsa Widitiarsa Utoyo (Bina Nusantara University & Bina Nusantara University - School of Design, Indonesia); Tobias Warbung (BINUS University & Towa Design, Indonesia); Titik Endahyani (Queensland University of Technology, Indonesia); Axel Juan Sukmawan (Bina Nusantara University, Indonesia) 235

Hybrid Protege Training Program in Corporate Setting: An Evaluative Case Study 239

Nurul Hijja Mazlan (Universiti Teknologi MARA, Malaysia); Nor Zanariah Talib (INSTITUT AMINUDDIN BAKI, Malaysia); Nur Aqilah R M Kamal (Universiti Teknologi MARA, Malaysia) 239

A User-Centered Design of Natural Language Processing for Maternal Monitoring Chatbot System 244

Sandra Hakiem Afrizal (Universitas Binawan, Indonesia); Nashrul Hakiem (Universitas Islam Negeri Syarif Hidayatullah, Indonesia); Adhistya Erna Permanasari (Universitas Gadjah Mada, Indonesia); Hadid Albab (UIN Syarif Hidayatullah, Indonesia); Guardian Yoki Sanjaya and Lutfan Lazuardi (Universitas Gadjah Mada, Indonesia)..... 244

Manufacturing Company Innovative Level Assessment Case Study of Volta Indonesia Semesta Incorporated 249

Bambang Purwanggono and Ratna Purwaningsih (Diponegoro University, Indonesia); Arfan Bakhtiar (Technical University of Berlin-Germany & Diponegoro University-Indonesia, Germany); Febrina Agusti (Duta Bangsa University, Indonesia); Kumara Pinasthika Dharaka (University of Bina Nusantara, Indonesia)..... 249

User Interface Design of Seminar and Workshop Information Mobile Apps for Self-Development 254

Jeremy Nathanael Wijaya and Yudhistya Ayu Kusumawati (Bina Nusantara University, Indonesia) 254

Concatenate Word Embedding for Text to Image Through Generative Adversarial Network..... 259

Rakhmi Khalida, rkhalida (Universitas Gunadarma, Indonesia); Sarifuddin Madenda (Gundarma University, Indonesia); Suryadi Harmanto (Gunadarma University, Indonesia); I Made Wiryana (Gundarma University, Indonesia)..... 259

Analysis of SMEs Consideration in Adopting New Technology Using Technology Acceptance Model 265

Iston Utama, Mulyani Karmagatri, Dian Kurnianingrum and Okky Rizkia Yustian (Bina Nusantara University, Indonesia) 265

The Usability Analysis of Human Resource Information System (HRIS) Using Usability Scale System and Concurrent Think Aloud..... 270

Ismayana Teguh Pratama, Rahmatika Putri and Rian Fernanda (Universitas Bina Nusantara, Indonesia); Sunardi Action (Bina Nusantara University, Indonesia)..... 270

Comparison of Machine Learning Methods in Sentiment Analysis PeduliLindungi Applications..... 276

Widya WH Cholil, MIT (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia); Febriyanti Panjaitan (Universitas Sriwijaya & Universitas Bina Darma, Indonesia); Ferdiansyah Ferdiansyah (Universitas Bina Darma & Universiti Teknologi Malaysia, Indonesia); Artika Arista, Ria Astriratma and Tri Rahayu (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia) 276

Performance Comparison of Rabin-Karp Algorithm and Winnowing Algorithm for Document Abstraction Similarity Detection 281

Anggit Dwi Hartanto and Yoga Pristyanto (Universitas Amikom Yogyakarta, Indonesia); Andy Saputra (Amikom University Yogyakarta, Indonesia); Eli Pujastuti, Atik Nurmasani and Ika Asti Astuti (Universitas Amikom Yogyakarta, Indonesia).. 281

Improved Chest X-Ray Image Quality Using Median and Gaussian Filter Methods 287

Lucky Indra Kesuma (Universitas Sriwijaya & Universitas Sjakhyakirti Palembang, Indonesia); Ermatita Ermatita (Sriwijaya University & Computer Science Faculty, Indonesia); Erwin E and Purwita Sari (Universitas Sriwijaya, Indonesia); Rudhy Purabaya (UPN Veteran Jakarta, Indonesia)..... 287

Implementation of Reinforcement Learning in 2D Based Games Using Open AI Gym 293

Bayu Setiaji (Universitas AMIKOM Yogyakarta, Indonesia); Eli Pujastuti and Muhammad Fairul Filza (Universitas Amikom Yogyakarta, Indonesia); Ahlihi Masruro (Universitas AMIKOM Yogyakarta, Indonesia); Yusuf Ashidicki Pradana (Universitas Amikom Yogyakarta, Indonesia) 293

Improved Support Vector Machine (SVM) Performance on Go-Jek Service Review Classification Using Particle Swarm Optimization (PSO)..... 298

Windha MP Duhita (Universitas AMIKOM Yogyakarta, Indonesia); Haryoko Haryoko (University of AMIKOM Yogyakarta, Indonesia)..... 298

Machine Learning Model for Detecting Fake News Content in Indonesian-Language Online Media 302

Inggrid Yanuar Risca Pratiwi (Politeknik Masamy Internasional, Indonesia); Anggit Ferdita Nugraha (Universitas AMIKOM Yogyakarta, Indonesia); Yoga Pristyanto, Rifda Faticha Alfa Aziza and Jeki Kuswanto (Universitas Amikom Yogyakarta, Indonesia); Ibnu Hadi Purwanto (Universitas AMIKOM Yogyakarta, Indonesia) 302

Problem Identification on Cardiovascular Disease Prevention Using Artificial Intelligence: A Literature Review 308

Boby Siswanto (Bina Nusantara University, Indonesia)..... 308

UI Pattern Analysis in Obtaining Highest Success Rate in University Admission Website..... 314

Arroyan Cahyaning Ratri and Eli Pujastuti (Universitas Amikom Yogyakarta, Indonesia); Muh Hanafi (Universitas Amikom Yogyakarta, Indonesia & Time Excellindo, Malaysia); Nuri Cahyono (Universitas Amikom Yogyakarta, Indonesia)314

Teman Berlingdung: Mobile-Based Student Counseling Service Application 320

Muhammad Fahrizal, Muhammad Raehan M Safitroh, Hanifa W Damayanti and Ihrom Wahyuni (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia); Chaerul Ilmi Al Ahyari (JL RS. FATMAWATI & UPN Veteran Jakarta, Indonesia); Ria Astriratma (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia)..... 320

BERT-Based Topic Modeling Approach for Malaria Research Publication..... 326

Alam Ahmad Hidayat (Bina Nusantara University, Indonesia); Rudi Nirwantono (Binus University, Indonesia); Arif Budiarto and Bens Pardamean (Bina Nusantara University, Indonesia)..... 326

A Video Filtering Method Using Greyscale and Canny Edge Detector in LabVIEW332

Putri Wulandari (University of Al Azhar Indonesia, Indonesia); Dwi Astharini (Universitas Al Azhar Indonesia, Indonesia); Wahyu Caesarendra (Universiti Brunei Darussalam & Diponegoro University, Brunei Darussalam); Triwiyanto Triwiyanto (Health Polytechnic Ministry of Health Surabaya, Indonesia); Maciej Sulowicz (Cracow University of Technology, Poland); Tjahjanto Tjahjanto (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia)..... 332

Comparison Analysis of Data Sending Performance Using the Cayenne and ThingSpeak IoT Platform 337

Kirana Astari Pranoto (Universiti Brunei Darussalam, Brunei Darussalam); Yogi Reza Ramadhan (CV. Rekeyasa Desain Manufaktur, Indonesia); Wahyu Caesarendra (Universiti Brunei Darussalam & Diponegoro University, Brunei Darussalam); Triwiyanto Triwiyanto (Health Polytechnic Ministry of Health Surabaya, Indonesia); Adam Glowacz (AGH University of Science and Technology, Poland); Santanu Kumar Dash (Vellore Institute of Technology, India); Bambang T Wahyono (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia) 337

Naive Bayes Classification Framework Model for Optimizing Prediction of Agrotourism Products Orange Gerga..... 343

Yogi Isro Mukti, YIM (Institut Teknologi Pagar Alam & Teknik Informatika, Indonesia); Vike Itteridi and Iskandar Sulaini (Institut Teknologi Pagar Alam,

Indonesia); Yuni Widiastiwi (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia)..... 343

Comparison ADAM-Optimizer and SGDM for Classification Images of Rice Leaf Disease.....348

Pujo Hari Saputro (Sam Ratulangi University, Indonesia); Dhina Puspasari Wijaya Action (Alma Ata University, Indonesia); Musthofa Galih Pradana (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia); Dyah Listianing Tyas (Universitas Trinita Manado, Indonesia); Wahyuni Fithratul Zalmi (Universitas Sam Ratulangi, Indonesia)..... 348

Ensemble Learning on Sentinel-1A Imagery for Garlic Field Classification.....354

Imas Sukaesih Sitanggang (Bogor Agricultural University, Indonesia); Muhammad Asyhar Agmalaro, Ahmad Al Banjaran Coeur d'Alene and Annisa Annisa (IPB University, Indonesia) 354

Sperm Cell Classification System Carrying X or Y Chromosome in Human With CNN Algorithm..... 360

I Gede Susrama Mas Diyasa (Universitas Pembangunan Nasional Veteran Jawa Timur, Indonesia); Kraugusteeliana Tambunan (Universitas Pembangunan Nasional, Indonesia); Wahyu S J Saputra (University of Pembangunan Nasional Veteran Jawa Timur, Indonesia)..... 360

Detection of Ovarian Cancer Risk Level Using the Web-Based Dempster Shafer Method 365

Kraugusteeliana Tambunan (Universitas Pembangunan Nasional, Indonesia); Nursaka Putra (STIKES Al-Insyirah Pekanbaru, Indonesia); Miandhani Denniz Yuniar (Universitas Selamat Sri, Indonesia); Dasril Aldo (Institut Teknologi Telkom Purwokerto, Indonesia); Anik Rahmawati and Viro Dharma Saputra (Universitas Selamat Sri, Indonesia) 365

English-To-Sundanese Translation Using Neural Machine Translation: Collection and Analytics..... 370

M. Octaviano Pratama (UPN Veteran Jakarta, Indonesia); Pamela Kareen (BISA AI Academy, Indonesia); Ermatita Ermatita (Sriwijaya University & Computer Science Faculty, Indonesia); Peng Choo and Miroslav Kosteki (STEMSEL Australia, Australia); Desmond Devendran (Logical Operation, USA) 370

The Effect of Imbalanced Classes on Retinal Blood Vessel Segmentation375

Ahmad Fauzi and Raju Wandira (UIN Imam Bonjol, Indonesia); Kraugusteeliana Tambunan (Universitas Pembangunan Nasional, Indonesia) 375

Comparison the New Computer Sciences Study Programs in Indonesia Using PyTrends..... 379

Tora Fahrudin (Telkom University, Indonesia); Asniar Asniar (Telkom University);
 Muhammad Faizul Ula (Telkom University, Indonesia) 379

Fine-Tuned MobileNetV2 and VGG16 Algorithm for Fish Image Classification 384

Devi Fitriannah, Kristien Suryaningrum and Noviyanti Tri Mareta Sagala (Bina Nusantara University, Indonesia); Vina Ayumi (Universitas Mercu Buana Jakarta, Indonesia); Siew Mooi Lim (Tunku Abdul Rahman University College, Malaysia) . 384

Development of Educational Application About Mental Disorders With Augmented Reality for Android..... 390

Jonathan Frederik Maringka, Rahadian Hargyo Pambuko and Mochammad Haldi Widiyanto (Bina Nusantara University, Indonesia) 390

Implementation of Feature Selection Based on Particle Swarm Optimization and Genetic Algorithm on Support Vector Regression Algorithm to Predict Student Performance 395

M. Riki Apriyadi (Doctoral Student of Engineering Science, Faculty of Engineering University of Sriwijaya Palembang, Indonesia); Ermatita Ermatita (Sriwijaya University & Computer Science Faculty, Indonesia); Dian Palupi Rini (Sriwijaya University & Computer Science Faculty, Indonesia); Yulnelly Yulnelly (UPN Veteran Jakarta, Indonesia)..... 395

Maturity Classification of Golek Mango Using Fuzzy C Means Clustering Method Based on HSI and YCbCr Color Space Transformation 401

Ibrohim Habiburrohman (Universitas Sebelas Maret, Indonesia); Esti Suryani (University of Sebelas Maret, Indonesia); Wiharto Wiharto (Universitas Sebelas Maret, Indonesia)..... 401

Implementation of Convolutional Neural Network Algorithm for Android-Based Classification of Taekwondo Martial Arts 407

Fauzan Akmal Mahdi and Desta Sandya Prasvita (UPN Veteran Jakarta, Indonesia); Theresiawati Theresiawati (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia)..... 407

Chatbot Application to Automate Services in FnB Business Using Seq2Seq LSTM 413

Ethan Wang and Winata Liadylova Putera (BINUS University, Indonesia); Henry Lucky and Andry Chowanda (Bina Nusantara University, Indonesia)..... 413

Analysis Performance of Support Vector Regression (SVR) for Congestion Prediction..... 418

Nindy Irzavika (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia); Putri Saptawati (Bandung Institute of Technology, Indonesia)..... 418

A Combination of Image Enhancement and U-Net Architecture for Segmentation in Identifying Brain Tumors on CT-SCAN Images 423

Anita Desiani (Universitas Sriwijaya, Indonesia); Muhammad Adrezo (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia); Nyayu Chika Marselina (Universitas Sriwijaya, Indonesia); Muhammad Arhami (Politeknik Negeri Lhokseumawe, Indonesia); Aulia Salsabila and Muhammad Gibran Al Filambany (Universitas Sriwijaya, Indonesia) 423

Implementation of Big Data Analytics for Machine Learning Model Using Hadoop and Spark Environment on Resizing Iris Dataset..... 429

Tresna Maulana Fahrudin, Prismahardi Aji Riyantoko and Kartika Maulida Hindrayani (Universitas Pembangunan Nasional Veteran Jawa Timur, Indonesia) 429

Comparison of Kernel Support Vector Machines in Conducting Sentiment Analysis Review of Buying Chips on the Shopee E-Marketplace in Indonesian..... 435

Muhammad Eka Purbaya, Diovianto Putra Rakhmadani, Maliana Puspa Arum and Luthfi Zian Nasifah (Institut Teknologi Telkom Purwokerto, Indonesia) 435

Application of Median Filter Method for Classification of Oil Palm Tree on LiDAR Images 441

Sabila Rafani Aliandra and Desta Sandya Prasvita (UPN Veteran Jakarta, Indonesia)441

Application of Genetic Algorithm K-Means Clustering of Villagers Characteristics for Smart Economy..... 445

Eneng Tita Tosida (IPB University & Universitas Pakuan, Indonesia); Indra Permana Solihin (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia); Fajar Delli Wihartiko (IPB University & Universitas Pakuan, Indonesia); Farhan Naufal (Pakuan University, Indonesia) 445

Implementation of Multiple Discriminant Analysis (MDA) for Clustering Smart Village in West Java Based Podes (Potensi Desa) Database 451

Eneng Tita Tosida (IPB University & Universitas Pakuan, Indonesia); Indra Permana Solihin (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia); Roni Jayawinangun and Deden Ardiansyah (Pakuan University, Indonesia) 451

Clustering of Tidal Swamp Soil Based on NPK Macronutrients Using the FCM Method 457

Suryati Suryati (Universitas Sriwijaya, Indonesia & Universitas Indo Global Mandiri, Indonesia); Ermatita Ermatita (Sriwijaya University & Computer Science Faculty, Indonesia); Dian Palupi Rini and Dedik Budianta (Universitas Sriwijaya, Indonesia)457

Comparison of Multi Layer Perceptron, Random Forest & Logistic Regression on Students Performance Test 462

Musthofa Galih Pradana (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia); Kenneth Palilingan (Sam Ratulangi University, Indonesia); Yuri Vanli Akay

(University of Sam Ratulangi, Indonesia); Dhina Puspasari Wijaya Action (Alma Ata University, Indonesia); Pujo Hari Saputro (Sam Ratulangi University, Indonesia) ... 462

Investment Feasibility Analysis of Base Transceiver Station (BTS) Tower Using Cost-Benefit Analysis on PT. XYZ 467

Arvy Muhammad Muhammad Reyhan and Sarah Shafira (Institute Technology of Sepuluh Nopember, Indonesia); Apol Pribadi Subriadi (Institut Teknologi Sepuluh Nopember, Indonesia) 467

Public Services Point Network Design for Local Government..... 473

Darius Antoni (Universitas Indo Global Mandiri, Indonesia); Muhammad Izman Herdiansyah (Universitas Bina Darma, Indonesia); Muhamad Akbar (Universitas Sriwijaya, Indonesia & Universitas Bina Insan, Indonesia); Muhamad Taufiq (Universitas Bina Darma, Indonesia); Bayu Hananto, Didit Widiyanto and I Wayan Widi Pradnyana (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia)..... 473

Information System Management of Palm Agriculture Using Laravel Framework 478

Muhammad Ilham Alhari, Muharman Lubis and Faisal Budiman (Telkom University, Indonesia) 478

Investigation Learning Model for Physics Courses Using Web Application With Case-Based Approach 484

Anindita Mardiani, Erly Krisnanik, Bayu Wibisono and Bambang Saras Yulistiawan (Universitas Pembangunan Nasional Veteran Jakarta, Indonesia)..... 484

Knowledge Management Model Review in Relation to Marketing and Branding.... 490

Fransiska Prihatini Sihotang (Sriwijaya University & Universitas MDP, Indonesia); Ermatita Ermatita (Sriwijaya University & Computer Science Faculty, Indonesia); Samsuryadi Samsuryadi and Dian Palupi Rini (Universitas Sriwijaya, Indonesia).... 490

The Determinant Factors of In-App Purchase Intention of International Genshin Impact Player Mediated by Perceived Value and Game Loyalty 496

Wiwin Lestari (Universitas Bina Nusantara, Indonesia); Sofia Ranti, Nadaffa Aisy Nozwar and Arta Moro Sundjaja (Bina Nusantara University, Indonesia)..... 496

Implementation of Haversine Algorithm and Geolocation for Travel Recommendations on Smart Applications for Backpackers in Bali 504

Abstract— The development of technology requires people to use and utilize it, including Small Medium Enterprise (SMEs). Social media can be used to help digitally market various kinds of SME products without the need for the physical stores. The main challenge of the digital market is that not all SMEs have social media, they are hampered by ignorance and many other problems. Moreover, they tend to use social media that are familiar to their circle, even though several other social media also have good benefits but have not been used effectively. Therefore, this study aims to rank social media based on their level of engagement. There are four criteria used in the User Engagement Scale which consist of perceived usability, focused attention, attractive appeal, and reward factor. The ranking method used is the Analytic Network Process as all the existing criteria are connected. The results showed that of the five social media alternatives used, E-Commerce got the best ranking seen from the four sides of engagement with a value of 0.366.

Keywords—social media, ranking, small medium enterprise, analytic network process

I. INTRODUCTION

Social media is currently one of the supports for small medium enterprises (SME) to market their products digitally. According to Hanafizadeh [1] stated that social networking sites for instance, (WhatsApp, Line, Telegram, and WeChat), Content communities (example, YouTube, TikTok, Vimeo), Blogs (Twitter, Blogspot), and online forums and discussion (TripAdvisor, Yelp, and FourSquare) as the types of social media. Some of these social media are familiar to SMEs and are used to sell online. The continued growth of social networking sites and digital platforms is influencing the strategy for many small and medium-sized multinational companies, but also large conglomerates are affected by the development of the digital world [2].

In extending the span of the modern worldwide business sectors, digitalization enjoys a few benefits that were recently possessed by SMEs working in metropolitan regions contrasted with SMEs situated in rustic regions. For instance, digitization creates an expansion of the rural SMEs to gain the worldwide business contacts through web-based showcasing. Digitization has empowered the rural SMEs to use conveyance coordinated factors for their metropolitan partners to benefit a cutthroat benefit is calculated. A sizable impact can be seen on the relationship between customers and companies or business actors positively from the social media. This social media is used to connect customers and is something that must exist to support businesses so that they can still thrive with competitors [3]. Communication tools are established between SMEs and companies as a benefit from the social media, it provides the opportunities as an advertising tool for promotion of their activities or products [4].

The utilization of social media and all kinds of information technology is growing in SMEs as well as potential produced by SMEs for the economy of a country, this shows that Small and Medium Enterprises (SMEs) need viable solutions to expand market share. Social Media is one of the most powerful advertising media to gain this objective. With the various kinds of social media that exist today, it can be a good solution for the SME owners. However, the SMEs in Indonesia have yet to have a brand / name due to the concerns of the social media use as only around 15.08% of SMEs market sell their products online [5]. Moreover, another issue is that some have yet to discuss whether they can profit from maintaining an e-commerce business, since they have impediments in the space of plan, appropriation, showcasing, and post-deals support. Another issue is security, which makes SMEs or people wonder whether or not to make exchanges. Besides, ignorance of the information, communication and technology system is an obstacle, so numerous SMEs or people are reluctant to carry out transactions of the website [6].

The benefits of social media are expanded brand awareness and good corporate image and relationship management, appropriate brand correspondence, improved sales, competitive benefit, and unexpected gamble uncertainty [7]. The gap between successful and unsuccessful or non-adopters of social media is therefore widening, making it harder for non-adopters to survive in the long term [8]. Of all the benefits and problems that exist, to amplify the advantages of social media and to provide views to SMEs, a social media ranking is created. This can give SME owners an idea of which social media owners have the best engagement to use in marketing their products.

This ranking is based on the User Engagement Scale (UES) by Heather L. O'Brien which consists of four variables (focused attention, perceived usability, aesthetic appeal, and reward factor) [9]. These four variables will be the criteria for ranking social media. The method used in the ranking is the analytic network process (ANP). It is known that ANP is an advanced version of analytic hierarchy process which ranks by pairwise comparisons between criteria with objectives, criteria with criteria, criteria and alternatives, as well as between alternatives. In addition, ANP can also measure the relative importance of each interconnected interaction in the network [10]. Therefore, the main objective of this study is to create a rank between all forms of social media based on the level of engagement criterias.

II. LITERATURE REVIEW

A. Related Work

Research on ANP has studied many rankings in various areas. Research conducted by Ratapol Wudhikarn and

several others have discussed the selection decisions of the various new product formulas by combining the ANP with Monte Carlo. The criteria in this study are divided into three, quality, cost and formula. Each of these criteria is further divided into sub-criteria. The result for best alternatives is Formula A with sensitivity analysis in several scenarios given [11].

In addition, research was conducted by David Jorge-García Vicente and Estruch-Guitart on Comparative analysis between AHP and ANP in prioritization of ecosystem services - A case study in a rice field area raised in the Guadalquivir marshes (Spain). The researchers focused on finding priority ecosystem services in agricultural areas by comparing AHP and ANP. This study revealed that ANP was way more effectively applied to cases that require high accuracy. While AHP is not compared with other elements and if there are problems with certain criteria, it can be prioritized by increasing the level of importance [12].

Another study discussing ANP entitled Using the Analytical Network Process to Select the Best Strategy for Reducing Risks in a Supply Chain was conducted by L. Hosseini, R. Tavakkoli-Moghaddam, B. Vahdani, S. M. Mousavi, and R. Kia. This study focuses on how to choose the best strategy in the supply chain by considering five alternatives consisting of total quality management (TQM), leanness, alignment, adaptability, and agility. Meanwhile, the criteria that will be assessed are based on supply risk, process risk, demand risk, and disruption risk. Each of these criteria also has its own sub-criteria. The result is that one of the best strategies with the highest score is TQM with a value of 0.483 [13].

B. Social Media dan SME

Social media is characterized as an interactive platform which allows everyone to communicate with each other, can quickly share content on various digital platforms, such as smartphones, edit content or change it, and to comment, just view or like, and also share with each other. content shared by others. All of these things are shared on social media that are widely known by many people, some of which are Instagram, Facebook, YouTube, Twitter, and LinkedIn [11].

Companies can promote and disseminate new products or services to customers and potential customers by utilizing social media, so that they can also create innovative business ideas [14]. Social media can also be utilized by organizations to produce, adjust, share and discuss internet content with customers globally [15]. Therefore, good customer engagement comes from using social media [16].

Businesses are increasingly taking advantage of the popularity of social media because it can be a liaison beyond personal conversations from individual to group and also to get feedback from customers [17]. Social media is also considered as a simple and powerful instrument for social connection building activities. Thus, using social media as an online business network can assist with expanding business support and make positive business performance and economic development, especially for rural SMEs [18]. Modern SMEs can profit from putting resources into mechanical advancements connected with Industry 4.0. Small-scale industries are characterized by flexible

production, and proximity to customers forces them to continually adapt technology to suit products [19].

C. Analytic Network Process (ANP)

The ANP was created by Saaty in the late 1990s and expanded and enhanced the conventional AHP by thinking about dependence and feedback; in this way, it is known as a nonexclusive type of the analytical hierarchy process [11]. The method needs a hierarchical structure and element connection and does not acknowledge interdependence relationships in a group of variables [20]. The ANP technique goes past the straight relationship among components and approves the cooperation between components [21]. Rather than a hierarchy, the major ANP framework is a network that replaces single direct associations with dependencies and feedback [22]. Unlike AHP, which cannot be used for measurement in terms of the dependence between factors. ANP can handle decisions regarding the interdependence between decision levels and attributes by providing a common framework [23].

It lays out the similar significance of the criteria and ranks and the alternatives available in the model. ANP assists to evaluate collaboration between clusters and then further among factors within a cluster. ANP works with human judgment to manage with priorities and compromises among goals and defines criteria for an issue. This method can be actually used when the criteria and alternatives are associated [24]. Support in decision making can take advantage of the analytic network process and also it can provide advantages in terms of assumptions whose variants are interdependent [25]. ANP consists of objectives, and has components similar to AHP where levels in AHP are replaced by clusters. Each cluster combines elements that have similar attributes. The relative importance score of the elements being compared is determined using a 1-to-9 scale [11].

There are six stages of ranking using analytic network process as follows [26]:

Step 1: Define criteria, build a network model and problem structure. In analytic network process, the first thing to do to solve the problems is to determine the criteria, objectives and alternatives. In this study, the aim is the ranking of social media. While the criteria used for the ranking are Focused Attention, Perceived Usability, Attractive Appeal, and Reward Factor according to the user engagement scale (UES) theory. Then the alternatives are Twitter, Facebook, Instagram, E-commerce, and Whatsapp.

Step 2: Create a pairwise comparison matrix and relative weights. This step involves the SME owner's view of the weight of each criterion. Pairwise comparisons were performed by assigning weights using the following Saaty weighting table [27]:

TABLE I. MATRIX SCALE

Scale	Definition
1	The same importance
3	Slightly more importance
5	Obviously more importance
7	More importance
9	Extremely more importance
2,4,6,8	The median value between two elements

Step 3: Consistency check, this step will influence the effectiveness of evaluation with consistency ratio (CR), random index (RI) and consistency index (CI). The accepted index value is when the CR value is < 0.1 ; or equal to 0, if the value exceeds this limit, then the pairwise comparison process will be repeated until it gets a consistent value.

$$CI = \frac{\lambda_{max} - n}{n - 1} \quad (1)$$

$$CR = \frac{CI}{RI} \quad (2)$$

Random Index is a value whose purpose is to assess the consistency of the pairwise comparison matrix obtained and derived as an average RI. The RI value itself is obtained from the random consistency index table as shown in table 2 [23].

TABLE 2. RANDOM INDEX

n	1	2	3	4	5	6	7	8	9
RI	0	0	0,52	0,89	1,11	1,25	1,35	1,40	1,45

Step 4: Form and complete the supermatrix. The unweighted supermatrix is calculated by replacing the internal priority vectors (relative weights), elements and clusters. Then, there is an obligation to standardize the unweighted supermatrix to add up each column and construct the weighted supermatrix [28].

Step 5: Calculate the limited supermatrix. To calculate the limited supermatrix, the weighted supermatrix has to be sufficiently raised to a bigger power to deliver convergence, or at least, all elements of each row are required to be identical [29].

Step 6: Pick the best alternative based on the weight value. The best alternative is selected based on the greatest value of each alternative.

III. METHODS

Social media is widely used by SMEs to help them promote their products to many people. Currently there are various choices of social media to choose from. In this study, the output is a ranking of social media seen from user engagement, the following research stage detailed in Figure 1:

Fig. 1. The research stages.

Problem identification started since the pandemic emerged where the use of digital technology was increasing, especially the use of social media. Merchants are starting to change their sales patterns to digital because they anticipate physical encounters with customers. Buyers also change their shopping patterns to online shopping to facilitate the process of purchasing goods to avoid catching the virus. From this point, SME owners who initially did not understand digital technology at all were slowly forced to change their habits.

But in fact, there are still many SME owners who stick with conventional sales and have not switched to digital. In addition, those who already have social media cannot use it optimally, even though several social media have good engagement. This ranking is expected to provide insight to SME owners on which social media has the best engagement based on the weight of the UES criteria.

Data collection was carried out for approximately 2 months, from June to August online using the Google Form, or offline by going directly to the owner of the SME. The data were obtained from SME owners to get the weighting of the criteria as well as alternatives. In this study, there were 3 SMEs that became the data source for the weighting process. These SMEs were given the same question regarding pairwise comparisons and weighting according to the ANP step. The ANP was chosen because it can rank selected factors based on the relationship between criteria, alternatives and goals. In line with this, the case studies in this research are related to each other. The ANP will compare each element until the highest weight is found for each of these elements.

Prior to ranking, the weights for each criterion are calculated and compared in pairs. The comparison process is carried out between criteria with objectives, criteria with criteria, criteria with alternatives and alternatives with alternatives. From the comparison results, the consistency level and supermatrix value will be calculated. In general, the ranking process with ANP is shown in Figure 2:

The criteria in this study are user engagement scale variables consisting of Focused Attention (FA), Perceived Usability (PU), Aesthetic Appeal (AA) criteria, and Reward Factor (RF). While the alternative is social media which is widely used by users whose data is also obtained from distributing questionnaires. Of the nine existing social media, it was then narrowed down to the top 5 that were widely used. The five social media are Instagram, Twitter, Facebook, E-Commerce, and Whatsapp.

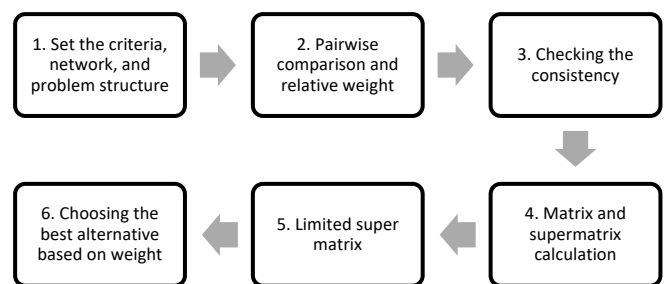

Fig. 2. ANP stages.

Pairwise comparison is completed by distributing the weighting questionnaires to SMEs. The SMEs are weighted based on their experience in using social media to market products. The comparative process that is significantly high can create inconsistencies in choosing the appropriate weighting. Therefore, there is a process called consistency check to find out how consistent the pairwise comparisons are. If it is inconsistent, then the calculation process must start from the beginning to get the consistent results. In

checking consistency, the value will be determined based on the consistency ratio as in formula (2).

Consistent results then proceed to the calculation stages of the matrix, supermatrix, and limited supermatrix. The results of these calculations are selected based on the highest value. This highest value is the output, where the social media with the highest value becomes the social media most widely used by SMEs based on the level of engagement.

IV. RESULTS

A. Comparing objectives with criteria, and between criteria and criteria

The selection criteria consisted of four variables that are adjusted to the variables on the User Engagement Scale (UES) which are Focused Attention, Perceived Usability, Aesthetic Appeal and Reward Factor. Unlike AHP, which is a simple hierarchy, in ANP the hierarchy is interconnected between criteria and alternatives. Therefore, the weighting points are more complex as per the ANP step. In this method there are also weighted, unweighted, and limited the supermatrix calculations, which are not present in the AHP calculation step. The hierarchy of social media rankings is shown in Figure 3. The hierarchy shows that the objectives are at the top, then below are the ranking criteria, and finally the ranking alternative to be chosen. This process is quite important because it is the initial stage in calculating ANP.

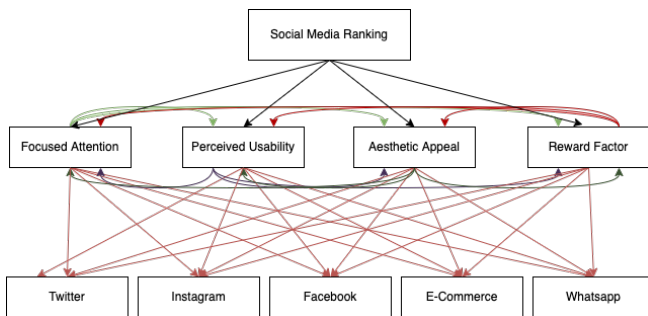

Fig. 3. Ranking hierarchy of social media.

This research aims to rank the social media. This goal will be compared with each of the criteria, namely Focused Attention, Perceived Usability, Aesthetic Appeal, and Reward Factor. Each of these criteria is also compared between each other. In addition, each criterion is compared again with the five alternatives, namely Twitter, Instagram, Facebook, E-Commerce, and Whatsapp. Table 3 shows the process of pairwise comparison between goals (social media rankings) and criteria. The value of this comparison may differ between SMEs. Several points explain that the FA is more important than the PU or vice versa. In this study, one data from one SME is displayed.

TABLE 3. PAIRWISE COMPARISON BETWEEN PURPOSE AND CRITERIA

	FA	PU	AA	RF
FA	1	2	3	1
PU	0,5	1	2	0,5
AA	0,33	0,5	1	0,33
RF	1	2	3	1
Total	2,83	5,5	9	2,83

TABLE 4. EIGENVECTOR VALUE

Criteria	FA	PU	AA	RF	Eigenvector
FA	0,35	0,36	0,33	0,35	0,35
PU	0,18	0,18	0,22	0,18	0,19
AA	0,12	0,09	0,11	0,12	0,11
RF	0,35	0,36	0,33	0,35	0,35
Total	1	1	1	1	

TABLE 5. CONSISTENCY CHECK

	FA	PU	AA	RF	Hasil	λ_{max}	CI	CR
FA	0,35	0,36	0,33	0,35	1,41	1	0	0
PU	0,18	0,18	0,22	0,18	0,76	1		
AA	0,12	0,09	0,11	0,12	0,44	1		
RF	0,35	0,36	0,33	0,35	1,41	1		
Total						4,01		

The eigenvector is obtained by calculating the average value of each paired comparison as shown in table 4. Due to the consistency check as expected, which is less than 0.1, it can be concluded that this comparison is consistent and can be continued to the next stage. After that is a comparison between criteria with criteria. The first criterion that is compared is Focused Attention as shown in table 5. The total score is obtained from calculating the total values of FA, PU, AA, and RF. Meanwhile, consistency checks were carried out using the CI and CR formulas. The final result of CR obtained is 0 so the results are consistent.

B. Comparison between criteria and alternatives

The alternative in this research is the social media widely used either by buyer or SME. Of the several existing social media, there are five important platforms that are the main focus of this research, namely Twitter, Facebook, Instagram, E-Commerce, and Whatsapp. These five alternatives are then compared with the four criteria. To make it easier to mention in the table, Twitter will be abbreviated as T, Instagram (I), Facebook (F), E-Commerce (E), and Whatsapp (W).

TABLE 6. PAIRWISE COMPARISON BETWEEN FOCUSED ATTENTION AND ALTERNATIVES

FA	T	I	F	E	W
T	1	0,33	0,25	0,33	0,5
I	3	1	0,5	1	2
F	4	2	1	2	3
E	3	1	0,5	1	2
W	2	0,5	0,33	0,5	1
Total	13	4,83	2,58	4,83	8,5

TABLE 7. EIGENVECTOR VALUE FOR ALTERNATIVES

FA	T	I	F	E	W	Eigen
T	0,08	0,07	0,1	0,07	0,06	0,07
I	0,23	0,21	0,19	0,21	0,24	0,21
F	0,31	0,41	0,39	0,41	0,35	0,38
E	0,23	0,21	0,19	0,21	0,24	0,21
W	0,15	0,1	0,13	0,1	0,12	0,12
Total	1	1	1	1	1	

TABLE 8. CONSISTENCY CHECK FOR ALTERNATIVES PAIRWISE COMPARISON

FA	T	I	F	E	W	λ_{max}	CI	CR
T	0,08	0,07	0,1	0,07	0,06	1	0,01	0,01
I	0,23	0,21	0,19	0,21	0,24	1,01		
F	0,31	0,41	0,39	0,41	0,35	1,01		

E	0,23	0,21	0,19	0,21	0,24	1,01		
W	0,15	0,1	0,13	0,1	0,12	1		
Sum						5,03		

The pairwise comparison is conducted to all the criteria and alternative as shown in table 6. In this table the comparison is between focused attention criteria and five alternatives (Twitter, Facebook, Instagram, E-Commerce, and Whatsapp). The eigenvector values in table 7 are obtained from the average of the total values per row. In addition, the total is also obtained from calculating the total of each column. The consistency check shown in table 8 also gets consistent results because the value is < 0.1 .

C. Pairwise comparison between alternatives and alternatives

The five alternatives were compared with each other to find out which SMEs prioritized the most as shown in table 9. The formula used is the same as before. The following table (10 and 11) were a pairwise comparison table for alternatives, it was between Twitter, Facebook, Instagram, E-commerce, and Whatsapp.

TABLE 9. PAIRWISE COMPARISON BETWEEN ALTERNATIVES

Alternatives	T	I	F	E	W
T	1	0,14	0,33	0,11	0,5
I	7	1	5	0,33	2
F	3	0,2	1	0,14	3
E	9	3	7	1	2
W	5	0,33	3	0,2	1
Total	25	4,68	16,33	1,79	8,5

TABLE 10. EIGENVECTOR VALUE FOR ALTERNATIVES

Alt	T	I	F	E	W	Eigen
T	0,04	0,03	0,02	0,06	0,02	0,03
I	0,28	0,21	0,31	0,19	0,31	0,26
F	0,12	0,04	0,06	0,08	0,03	0,07
E	0,36	0,64	0,43	0,56	0,52	0,21p
W	0,2	0,07	0,18	0,11	0,1	0,12
Total	1	1	1	1	1	

TABLE 11. CONSISTENCY CHECK FOR ALTERNATIVES PAIRWISE COMPARISON

Alt	T	I	F	E	W	λ_{max}	CI	CR
T	0,03	0,04	0,02	0,06	0,03	1,02	0,06	0,05
I	0,24	0,26	0,34	0,17	0,4	1,09		
F	0,1	0,05	0,07	0,07	0,04	1,01		
E	0,31	0,78	0,47	0,47	0,67	1,09		
W	0,17	0,09	0,2	0,2	0,13	1,04		
Sum						5,03		

D. Calculate the unweighted, weighed, and limited supermatrix

The following table is the result of the calculation of the unweighted supermatrix. This value as shown in table 12 is obtained from pairwise comparisons that have been carried out in the previous stage. Then in the weighted supermatrix the value is obtained from the results of the calculation between the eigenvalues and the unweighted supermatrix, so the results are shown in table 13.

TABLE 12. UNWEIGHTED SUPERMATRIX

Alternatives	T	I	F	E	W
T	1	0,1	0,1	0,1	0,14
I	0,23	1	0,28	0,47	0,26
F	0,12	0,28	1	0,28	0,14
E	0,42	0,47	0,47	1	0,45
W	0,23	0,16	0,16	0,16	1
Total	2	2	2	2	

TABLE 13. WEIGHTED SUPERMATRIX

Alt	T	I	F	E	W	Results	Total
T	0,035	0,025	0,007	0,048	0,019	0,134	0,067
I	0,008	0,26	0,019	0,234	0,035	0,556	0,278
F	0,004	0,072	0,068	0,139	0,019	0,302	0,151
E	0,015	0,121	0,032	0,503	0,061	0,731	0,366
W	0,008	0,042	0,011	0,081	0,134	0,276	0,138
Total						2	1

TABLE 14. LIMITED SUPERMATRIX

Alt	T	I	F	E	W	Total
T	0,004	0,019	0,01	0,024	0,009	0,067
I	0,019	0,077	0,042	0,102	0,038	0,278
F	0,01	0,042	0,023	0,055	0,021	0,151
E	0,024	0,102	0,055	0,134	0,05	0,366
W	0,009	0,038	0,021	0,05	0,019	0,138
Total	0,067	0,278	0,151	0,366	0,138	1

From all the results of these calculations then look for the highest value. The total of the limited supermatrix is shown in table 14. The highest rank is the one with the highest value. The highest score from the social media is E-Commerce with a total score of 0.366. To put it in the nutshell, as illustrates in Figure 4, the ranking of social media when viewed from the category of UES is E-Commerce.

Fig. 4. Social media ranking result

Based on calculations like the picture above, one level below e-commerce is Instagram, which is one of the SMEs owner favorites because it is image-based. Then followed by Facebook with a value of 0.15, Whatsapp with 0.13, and finally Twitter with a value of 0.06. The results of social media ranking were basically lead SMEs owner to open up and try another social media to market their product and make it as a consideration. In addition to theoretical implication, ANP is suitable for solving problems in which criteria and alternatives are interconnected in a network. Simple problems can use AHP, while problems that have a broad and complex scope can use ANP. However, ANP also

has limitations that cannot overcome the problem of uncertainty in the criteria.

V. CONCLUSIONS

This study discusses the ranking of social media based on four categories of user engagement scale. The determination of the weight for the ranking is obtained from interviews with SME owners who have used social media for marketing their business products. From the results of calculations using ANP, the ranking results are that e-commerce becomes social media which they think is good in terms of engagement. The limitation in this study is that the weighting is carried out with majority of older SME owners, which tend to affect the weighting results because there are definitely differences in views for young and old owners. Further research is that the weighting process can be done to various respondent, ranging from 20 until above 50 years old, to get many perspectives of each generation.

ACKNOWLEDGMENT

Thanks in advance for Kemdikbudristek's grant in Penelitian Dosen Pemula (PDP) and SMEs owner from several places to obtain the data.

Abstract— The development of technology requires people to use and utilize it, including Small Medium Enterprise (SMEs). Social media can be used to help digitally market various kinds of SME products without the need for the physical stores. The main challenge of the digital market is that not all SMEs have social media, they are hampered by ignorance and many other problems. Moreover, they tend to use social media that are familiar to their circle, even though several other social media also have good benefits but have not been used effectively. Therefore, this study aims to rank social media based on their level of engagement. There are four criteria used in the User Engagement Scale which consist of perceived usability, focused attention, attractive appeal, and reward factor. The ranking method used is the Analytic Network Process as all the existing criteria are connected. The results showed that of the five social media alternatives used, E-Commerce got the best ranking seen from the four sides of engagement with a value of 0.366.

Keywords—social media, ranking, small medium enterprise, analytic network process

I. INTRODUCTION

Social media is currently one of the supports for small medium enterprises (SME) to market their products digitally. According to Hanafizadeh [1] stated that social networking sites for instance, (WhatsApp, Line, Telegram, and WeChat), Content communities (example, YouTube, TikTok, Vimeo), Blogs (Twitter, Blogspot), and online forums and discussion (TripAdvisor, Yelp, and FourSquare) as the types of social media. Some of these social media are familiar to SMEs and are used to sell online. The continued growth of social networking sites and digital platforms is influencing the strategy for many small and medium-sized multinational companies, but also large conglomerates are affected by the development of the digital world [2].

In extending the span of the modern worldwide business sectors, digitalization enjoys a few benefits that were recently possessed by SMEs working in metropolitan regions contrasted with SMEs situated in rustic regions. For instance, digitization creates an expansion of the rural SMEs to gain the worldwide business contacts through web-based showcasing. Digitization has empowered the rural SMEs to use conveyance coordinated factors for their metropolitan partners to benefit a cutthroat benefit is calculated. A sizable impact can be seen on the relationship between customers and companies business actors positively from the social media. This social media is used to connect customers and is something that must exist to support businesses so that they can still thrive with competitors [3]. Communication tools are established between SMEs and companies as a benefit from the social media, it provides the opportunities as an advertising tool for promotion of their activities or products [4].

The utilization of social media and all kinds of information technology is growing in SMEs as well as potential produced by SMEs for the economy of a country, this shows that Small and Medium Enterprises (SMEs) need viable solutions to expand market share. Social Media is one of the most powerful advertising media to gain this objective. With the various kinds of social media that exist today, it can be a good solution for the SME owners. However, the SMEs in Indonesia have yet to have a brand / name due to the concerns of the social media use as only around 15.08% of SMEs market sell their products online [5]. Moreover, another issue is that some have yet to discuss whether they can profit from maintaining an e-commerce business, since they have impediments in the space of plan, appropriation, showcasing, and post-deals support. Another issue is security, which makes SMEs or people wonder whether or not to make exchanges. Besides, ignorance of the information, communication and technology system is an obstacle, so numerous SMEs or people are reluctant to carry out transactions of the website [6].

The benefits of social media are expanded brand awareness and good corporate image and relationship management, appropriate brand correspondence, improved sales, competitive benefit, and unexpected gamble uncertainty [7]. The gap between successful and unsuccessful or non-adopters of social media is therefore widening, making it harder for non-adopters to survive in the long term [8]. Of all the benefits and problems that exist, to amplify the advantages of social media and to provide views to SMEs, a social media ranking is created. This can give SME owners an idea of which social media owners have the best engagement to use in marketing their products.

This ranking is based on the User Engagement Scale (UES) by Heather L. O'Brien which consists of four variables (focused attention, perceived usability, aesthetic appeal, and reward factor) [9]. These four variables will be the criteria for ranking social media. The method used in the ranking is the analytic network process (ANP). It is known that ANP is an advanced version of analytic hierarchy process which ranks by pairwise comparisons between criteria with objectives, criteria with criteria, criteria and alternatives, as well as between alternatives. In addition, ANP can also measure the relative importance of each interconnected interaction in the network [10]. Therefore, the main objective of this study is to create a rank between all forms of social media based on the level of engagement criterias.

II. LITERATURE REVIEW

A. Related Work

Research on ANP has studied many rankings in various areas. Research conducted by Ratapol Wudhikarn and

several others have discussed the selection decisions of the various new product formulas by combining the ANP with Monte Carlo. The criteria in this study are divided into three, quality, cost and formula. Each of these criteria is further divided into sub-criteria. The result for best alternatives is Formula A with sensitivity analysis in several scenarios given [11].

In addition, research was conducted by David Jorge-García Vicente and Estruch-Guitart on Comparative analysis between AHP and ANP in prioritization of ecosystem services - A case study in a rice field area raised in the Guadalquivir marshes (Spain). The researchers focused on finding priority ecosystem services in agricultural areas by comparing AHP and ANP. This study revealed that ANP was way more effectively applied to cases that require high accuracy. While AHP is not compared with other elements and if there are problems with certain criteria, it can be prioritized by increasing the level of importance [12].

Another study discussing ANP entitled Using the Analytical Network Process to Select the Best Strategy for Reducing Risks in a Supply Chain was conducted by L. Hosseini, R. Tavakkoli-Moghaddam, B. Vahdani, S. M. Mousavi, and R. Kia. This study focuses on how to choose the best strategy in the supply chain by considering five alternatives consisting of total quality management (TQM), leanness, alignment, adaptability, and agility. Meanwhile, the criteria that will be assessed are based on supply risk, process risk, demand risk, and disruption risk. Each of these criteria also has its own sub-criteria. The result is that one of the best strategies with the highest score is TQM with a value of 0.483 [13].

B. Social Media dan SME

Social media is characterized as an interactive platform which allows everyone to communicate with each other, can quickly share content on various digital platforms, such as smartphones, edit content or change it, and to comment, just view or like, and also share with each other. content shared by others. All of these things are shared on social media that are widely known by many people, some of which are Instagram, Facebook, YouTube, Twitter, and LinkedIn [11].

Companies can promote and disseminate new products or services to customers and potential customers by utilizing social media, so that they can also create innovative business ideas [14]. Social media can also be utilized by organizations to produce, adjust, share and discuss internet content with customers globally [15]. Therefore, good customer engagement comes from using social media [16].

Businesses are increasingly taking advantage of the popularity of social media because it can be a liaison beyond personal conversations from individual to group and also to get feedback from customers [17]. Social media is also considered as a simple and powerful instrument for social connection building activities. Thus, using social media as an online business network can assist with expanding business support and make positive business performance and economic development, especially for rural SMEs [18]. Modern SMEs can profit from putting resources into mechanical advancements connected with Industry 4.0. Small-scale industries are characterized by flexible

production, and proximity to customers forces them to continually adapt technology to suit products [19].

C. Analytic Network Process (ANP)

The ANP was created by Saaty in the late 1990s and expanded and enhanced the conventional AHP by thinking about dependence and feedback; in this way, it is known as a nonexclusive type of the analytical hierarchy process [11]. The method needs a hierarchical structure and element connection and does not acknowledge interdependence relationships in a group of variables [20]. The ANP technique goes past the straight relationship among components and approves the cooperation between components [21]. Rather than a hierarchy, the major ANP framework is a network that replaces single direct associations with dependencies and feedback [22]. Unlike AHP, which cannot be used for measurement in terms of the dependence between factors. ANP can handle decisions regarding the interdependence between decision levels and attributes by providing a common framework [23].

It lays out the similar significance of the criteria and ranks and the alternatives available in the model. ANP assists to evaluate collaboration between clusters and then further among factors within a cluster. ANP works with human judgment to manage with priorities and compromises among goals and defines criteria for an issue. This method can be actually used when the criteria and alternatives are associated [24]. Support in decision making can take advantage of the analytic network process and also it can provide advantages in terms of assumptions whose variants are interdependent [25]. ANP consists of objectives, and has components similar to AHP where levels in AHP are replaced by clusters. Each cluster combines elements that have similar attributes. The relative importance score of the elements being compared is determined using a 1-to-9 scale [11].

There are six stages of ranking using analytic network process as follows [26]:

Step 1: Define criteria, build a network model and problem structure. In analytic network process, the first thing to do to solve the problems is to determine the criteria, objectives and alternatives. In this study, the aim is the ranking of social media. While the criteria used for the ranking are Focused Attention, Perceived Usability, Attractive Appeal, and Reward Factor according to the user engagement scale (UES) theory. Then the alternatives are Twitter, Facebook, Instagram, E-commerce, and Whatsapp.

Step 2: Create a pairwise comparison matrix and relative weights. This step involves the SME owner's view of the weight of each criterion. Pairwise comparisons were performed by assigning weights using the following Saaty weighting table [27]:

TABLE I. MATRIX SCALE

Scale	Definition
1	The same importance
3	Slightly more importance
5	Obviously more importance
7	More importance
9	Extremely more importance
2,4,6,8	The median value between two elements

Step 3: Consistency check, this step will influence the effectiveness of evaluation with consistency ratio (CR), random index (RI) and consistency index (CI). The accepted index value is when the CR value is < 0.1 ; or equal to 0, if the value exceeds this limit, then the pairwise comparison process will be repeated until it gets a consistent value.

$$CI = \frac{\lambda_{max} - n}{n - 1} \quad (1)$$

$$CR = \frac{CI}{RI} \quad (2)$$

Random Index is a value whose purpose is to assess the consistency of the pairwise comparison matrix obtained and derived as an average RI. The RI value itself is obtained from the random consistency index table as shown in table 2 [23].

TABLE 2. RANDOM INDEX

n	1	2	3	4	5	6	7	8	9
RI	0	0	0,52	0,89	1,11	1,25	1,35	1,40	1,45

Step 4: Form and complete the supermatrix. The unweighted supermatrix is calculated by replacing the internal priority vectors (relative weights), elements and clusters. Then, there is an obligation to standardize the unweighted supermatrix to add up each column and construct the weighted supermatrix [28].

Step 5: Calculate the limited supermatrix. To calculate the limited supermatrix, the weighted supermatrix has to be sufficiently raised to a bigger power to deliver convergence, or at least, all elements of each row are required to be identical [29].

Step 6: Pick the best alternative based on the weight value. The best alternative is selected based on the greatest value of each alternative.

III. METHODS

Social media is widely used by SMEs to help them promote their products to many people. Currently there are various choices of social media to choose from. In this study, the output is a ranking of social media seen from user engagement, the following research stage detailed in Figure 1:

Fig. 1. The research stages.

Problem identification started since the pandemic emerged where the use of digital technology was increasing, especially the use of social media. Merchants are starting to change their sales patterns to digital because they anticipate physical encounters with customers. Buyers also change their shopping patterns to online shopping to facilitate the process of purchasing goods to avoid catching the virus. From this point, SME owners who initially did not understand digital technology at all were slowly forced to change their habits.

But in fact, there are still many SME owners who stick with conventional sales and have not switched to digital. In addition, those who already have social media cannot use it optimally, even though several social media have good engagement. This ranking is expected to provide insight to SME owners on which social media has the best engagement based on the weight of the UES criteria.

Data collection was carried out for approximately 2 months, from June to August online using the Google Form, or offline by going directly to the owner of the SME. The data were obtained from SME owners to get the weighting of the criteria as well as alternatives. In this study, there were 3 SMEs that became the data source for the weighting process. These SMEs were given the same question regarding pairwise comparisons and weighting according to the ANP step. The ANP was chosen because it can rank selected factors based on the relationship between criteria, alternatives and goals. In line with this, the case studies in this research are related to each other. The ANP will compare each element until the highest weight is found for each of these elements.

Prior to ranking, the weights for each criterion are calculated and compared in pairs. The comparison process is carried out between criteria with objectives, criteria with criteria, criteria with alternatives and alternatives with alternatives. From the comparison results, the consistency level and supermatrix value will be calculated. In general, the ranking process with ANP is shown in Figure 2:

The criteria in this study are user engagement scale variables consisting of Focused Attention (FA), Perceived Usability (PU), Aesthetic Appeal (AA) criteria, and Reward Factor (RF). While the alternative is social media which is widely used by users whose data is also obtained from distributing questionnaires. Of the nine existing social media, it was then narrowed down to the top 5 that were widely used. The five social media are Instagram, Twitter, Facebook, E-Commerce, and Whatsapp.

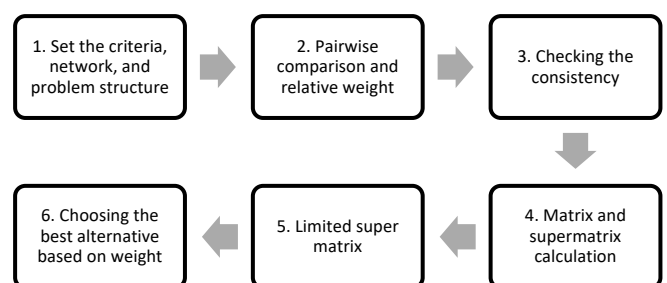

Fig. 2. ANP stages.

Pairwise comparison is completed by distributing the weighting questionnaires to SMEs. The SMEs are weighted based on their experience in using social media to market products. The comparative process that is significantly high can create inconsistencies in choosing the appropriate weighting. Therefore, there is a process called consistency check to find out how consistent the pairwise comparisons are. If it is inconsistent, then the calculation process must start from the beginning to get the consistent results. In

checking consistency, the value will be determined based on the consistency ratio as in formula (2).

Consistent results then proceed to the calculation stages of the matrix, supermatrix, and limited supermatrix. The results of these calculations are selected based on the highest value. This highest value is the output, where the social media with the highest value becomes the social media most widely used by SMEs based on the level of engagement.

IV. RESULTS

A. Comparing objectives with criteria, and between criteria and criteria

The selection criteria consisted of four variables that are adjusted to the variables on the User Engagement Scale (UES) which are Focused Attention, Perceived Usability, Aesthetic Appeal and Reward Factor. Unlike AHP, which is a simple hierarchy, in ANP the hierarchy is interconnected between criteria and alternatives. Therefore, the weighting points are more complex as per the ANP step. In this method there are also weighted, unweighted, and limited the supermatrix calculations, which are not present in the AHP calculation step. The hierarchy of social media rankings is shown in Figure 3. The hierarchy shows that the objectives are at the top, then below are the ranking criteria, and finally the ranking alternative to be chosen. This process is quite important because it is the initial stage in calculating ANP.

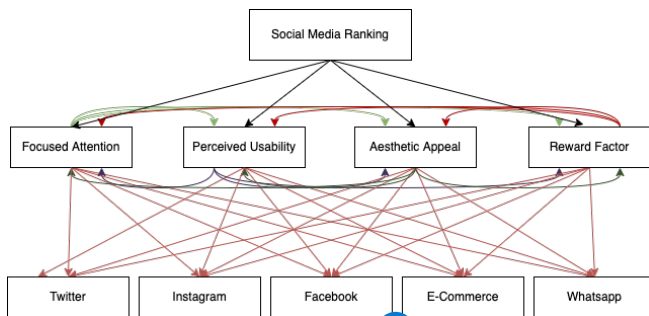

Fig. 3. Ranking hierarchy of social media.

This research aims to rank the social media. This goal will be compared with each of the criteria, namely Focused Attention, Perceived Usability, Aesthetic Appeal, and Reward Factor. Each of these criteria is also compared between each other. In addition, each criterion is compared again with the five alternatives, namely Twitter, Instagram, Facebook, E-Commerce, and Whatsapp. Table 3 shows the process of pairwise comparison between goals (social media rankings) and criteria. The value of this comparison may differ between SMEs. Several points explain that the FA is more important than the PU or vice versa. In this study, one data from one SME is displayed.

TABLE 3. PAIRWISE COMPARISON BETWEEN PURPOSE AND CRITERIA

	FA	PU	AA	RF
FA	1	2	3	1
PU	0,5	1	2	0,5
AA	0,33	0,5	1	0,33
RF	1	2	3	1
Total	2,83	5,5	9	2,83

TABLE 4. EIGENVECTOR VALUE

Criteria	FA	PU	AA	RF	Eigenvector
FA	0,35	0,36	0,33	0,35	0,35
PU	0,18	0,18	0,22	0,18	0,19
AA	0,12	0,09	0,11	0,12	0,11
RF	0,35	0,36	0,33	0,35	0,35
Total	1	1	1	1	

TABLE 5. CONSISTENCY CHECK

	FA	PU	AA	RF	Hasil	λ_{max}	CI	CR
FA	0,35	0,36	0,33	0,35	1,41	1	0	0
PU	0,18	0,18	0,22	0,18	0,76	1		
AA	0,12	0,09	0,11	0,12	0,44	1		
RF	0,35	0,36	0,33	0,35	1,41	1		
Total						4,01		

The eigenvector is obtained by calculating the average value of each paired comparison as shown in table 4. Due to the consistency check as expected, which is less than 0.1, it can be concluded that this comparison is consistent and can be continued to the next stage. After that is a comparison between criteria with criteria. The first criterion that is compared is Focused Attention as shown in table 5. The total score is obtained from calculating the total values of FA, PU, AA, and RF. Meanwhile, consistency checks were carried out using the CI and CR formulas. The final result of CR obtained is 0 so the results are consistent.

B. Comparison between criteria and alternatives

The alternative in this research is the social media widely used either by buyer or SME. Of the several existing social media, there are five important platforms that are the main focus of this research, namely Twitter, Facebook, Instagram, E-Commerce, and Whatsapp. These five alternatives are then compared with the four criteria. To make it easier to mention in the table, Twitter will be abbreviated as T, Instagram (I), Facebook (F), E-Commerce (E), and Whatsapp (W).

TABLE 6. PAIRWISE COMPARISON BETWEEN FOCUSED ATTENTION AND ALTERNATIVES

FA	T	I	F	E	W
T	1	0,33	0,25	0,33	0,5
I	3	1	0,5	1	2
F	4	2	1	2	3
E	3	1	0,5	1	2
W	2	0,5	0,33	0,5	1
Total	13	4,83	2,58	4,83	8,5

TABLE 7. EIGENVECTOR VALUE FOR ALTERNATIVES

FA	T	I	F	E	W	Eigen
T	0,08	0,07	0,1	0,07	0,06	0,07
I	0,23	0,21	0,19	0,21	0,24	0,21
F	0,31	0,41	0,39	0,41	0,35	0,38
E	0,23	0,21	0,19	0,21	0,24	0,21
W	0,15	0,1	0,13	0,1	0,12	0,12
Total	1	1	1	1	1	

TABLE 8. CONSISTENCY CHECK FOR ALTERNATIVES PAIRWISE COMPARISON

FA	T	I	F	E	W	λ_{max}	CI	CR
T	0,08	0,07	0,1	0,07	0,06	1	0,01	0,01
I	0,23	0,21	0,19	0,21	0,24	1,01		
F	0,31	0,41	0,39	0,41	0,35	1,01		

E	0,23	0,21	0,19	0,21	0,24	1,01		
W	0,15	0,1	0,13	0,1	0,12	1		
Sum						5,03		

The pairwise comparison is conducted to all the criteria and alternative as shown in table 6. In this table the comparison is between focused attention criteria and five alternatives (Twitter, Facebook, Instagram, E-Commerce, and Whatsapp). The eigenvector values in table 7 are obtained from the average of the total values per row. In addition, the total is also obtained from calculating the total of each column. The consistency check shown in table 8 also gets consistent results because the value is < 0.1 .

C. Pairwise comparison between alternatives and alternatives

The five alternatives were compared with each other to find out which SMEs prioritized the most as shown in table 9. The formula used is the same as before. The following table (10 and 11) were a pairwise comparison table for alternatives, it was between Twitter, Facebook, Instagram, E-commerce, and Whatsapp.

TABLE 9. PAIRWISE COMPARISON BETWEEN ALTERNATIVES

Alternatives	T	I	F	E	W
T	1	0,14	0,33	0,11	0,5
I	7	1	5	0,33	2
F	3	0,2	1	0,14	3
E	9	3	7	1	2
W	5	0,33	3	0,2	1
Total	25	4,68	16,33	1,79	8,5

TABLE 10. EIGENVECTOR VALUE FOR ALTERNATIVES

D. Calculate the unweighted, weighed, and limited supermatrix

The following table is the result of the calculation of the unweighted supermatrix. This value as shown in table 12 is obtained from pairwise comparisons that have been carried out in the previous stage. Then in the weighted supermatrix the value is obtained from the results of the calculation between the eigenvalues and the unweighted supermatrix, so the results are shown in table 13.

TABLE 12. UNWEIGHTED SUPERMATRIX

Alternatives	T	I	F	E	W
T	1	0,1	0,1	0,1	0,14
I	0,23	1	0,28	0,47	0,26
F	0,12	0,28	1	0,28	0,14
E	0,42	0,47	0,47	1	0,45
W	0,23	0,16	0,16	0,16	1
Total	2	2	2	2

W	0,008	0,042	0,011	0,081	0,134	0,276	0,138
Total						2	1

TABLE 14. LIMITED SUPERMATRIX

Alt	T	I	F	E	W	Total
T	0,004	0,019	0,01	0,024	0,009	0,067
I	0,019	0,077	0,042	0,102	0,038	0,278
F	0,01	0,042	0,023	0,055	0,021	0,151
E	0,024	0,102	0,055	0,134	0,05	0,366
W	0,009	0,038	0,021	0,05	0,019	0,138
Total	0,067	0,278	0,151	0,366	0,138	1

From all the results of these calculations then look for the highest value. The total of the limited supermatrix is shown in table 14. The highest rank is the one with the highest value. The highest score from the social media is E-Commerce with a total score of 0.366. To put it in the nutshell, as illustrates in ²² figure 4, the ranking of social media when viewed from the category of UES is E-Commerce.

Fig. 4. Social media ranking result

Based on calculations like the picture above, one level below e-commerce is Instagram, which is one of the SMEs owner favorites because it is image-based. Then followed by Facebook with a value of 0.15, Whatsapp with 0.13, and finally Twitter with a value of 0.06. The results of social media ranking were basically lead SMEs owner to open up and try another social media to market their product and make it as a consideration. In addition to theoretical implication, ANP is suitable for solving problems in which criteria and alternatives are interconnected in a network. Simple problems can use AHP, while problems that have a broad and complex scope can use ANP. However, ANP also

has limitations that cannot overcome the problem of uncertainty in the criteria.

V. CONCLUSIONS

18 This study discusses the ranking of social media based on four categories of user engagement scale. The determination of the weight for the ranking is obtained from interviews with SME owners who have used social media for marketing their business products. From the results of calculations using ANP, the ranking results are that e-commerce becomes social media which they think is good in terms of engagement. The limitation in this study is that the weighting is carried out with majority of older SME owners, which tend to affects the weighting results because there are definitely differences in views for young and old owners. Further research is that the weighting process can be done to various respondent, ranging from 20 until above 50 years old, to get many perspectives of each generation.

ACKNOWLEDGMENT

Thanks in advance for Kemdikbudristek's grant in Penelitian Dosen Pemula (PDP) and SMEs owner from several places to obtain the data.
